Abstract

From January to June 2003 a national survey was conducted to test the awareness and preparedness of coastal communities to natural hazards (Johnston et al., 2003). Respondents from 42 communities throughout New Zealand were asked approximately 50 questions. The Wellington Region was represented by Castlepoint, Eastbourne, Lyall Bay, Raumati, Riversdale, Seatoun and Te Horo. This report interprets the results of the survey with the aim of comparing the results of the seven communities from the Wellington Region with the results for the rest of New Zealand.

1. Introduction

In New Zealand little work has been done to gauge the awareness of residents and visitors to the risks of living at or visiting the coast. With that in mind, from January to June 2003, the Institute of Geological and Nuclear Sciences (GNS) and the National Institute of Water and Atmospheric Research (NIWA) undertook a national survey of coastal communities. The survey was carried out in association with local authorities, including Greater Wellington, to build a picture of social dynamics at work in coastal communities in relation to natural hazards.

The objectives of the survey were to;

1. Assess perceptions of coastal risk in the context of other risks.
2. Assess levels of preparedness for emergencies.
3. Assess views on management options and the willingness to pay for the mitigation of coastal hazards.

The survey results plotted here are from Johnston et al. (2003). This report seeks to highlight and explain the results for the Wellington Region. Comparisons are made between the Wellington Region's results and those for the rest of New Zealand. Intra-regional comparisons are also made for the seven communities in the Wellington Region. The results for the Willingness to Pay questions are to be covered in a separate report due to be released later in 2004.

2. The Communities

9000 surveys were delivered to 42 coastal communities from Riverton to Waipu Cove. 3458 respondents answered the approximately 50 questions. The Greater Wellington region was represented by seven coastal communities: Castlepoint, Eastbourne, Lyall Bay, Raumati, Riversdale, Seatoun and Te Horo. The locations of these communities is shown in Figure 1.

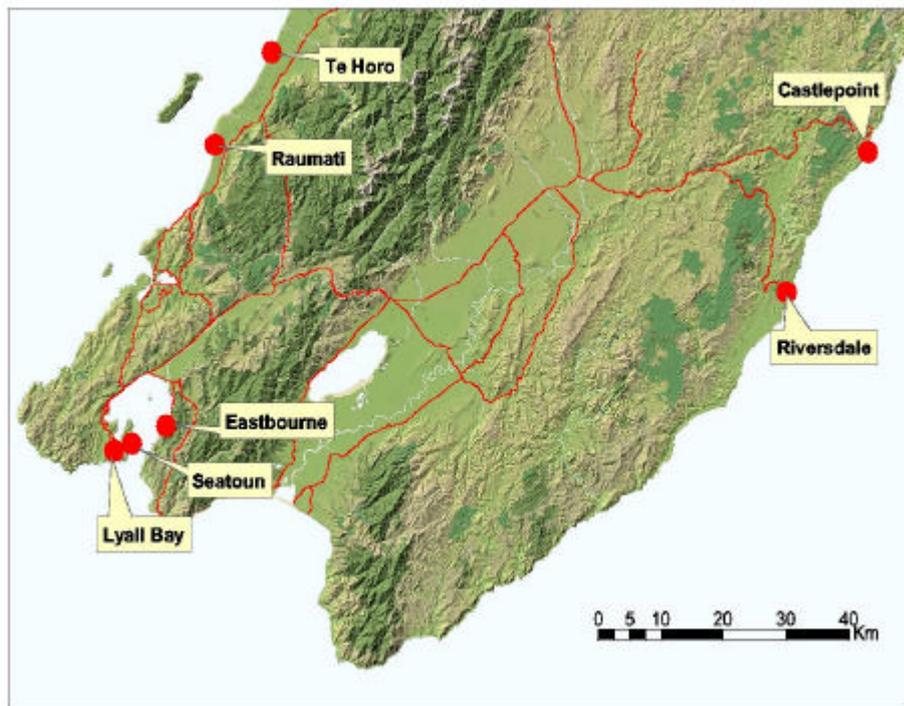

Figure 1: Map of the Wellington Region Communities

Each of the coastal communities has different physical characteristics and face different types of natural hazards.

Castlepoint and Riversdale are small Eastern Wairarapa Coastal beach settlements whose populations increase substantially during the Summer months. Both are at high risk from distant generated tsunami. Castlepoint has protection works between the main road and the beach.

Eastbourne, on the eastern side of Wellington harbour is a narrow coastal settlement between the Harbour and the East Harbour hills. Much of the village is built on sand dunes, and the steep hills behind are periodically subject to scrub fires. There are various types of protection works between Eastbourne and the Harbour.

Raumati and Te Horo, on the Kapiti Coast, are sandy beaches. Raumati in particular has had severe erosion issues, currently the topic of study for Kapiti Coast District Council. The importance of coastal erosion issues to Raumati residents is reflected by the high response rate for that community. Te Horo has a smaller population and is less developed than some of the other coastal communities.

Lyall Bay on Wellington's South Coast is a very popular surf beach within a sweeping sandy bay. There is a range of recreational activities on the beach, enjoyed by local residents and visitors alike.

Seatoun is a mix of some sandy beach and rocky foreshore near the entrance to Wellington Harbour. It can be a very vigorous environment with strong winds and heavy wave action.

The response rates for each of the Wellington communities is given below.

Table 1: Response Rates of Wellington Region communities

Location	Number Delivered	Number Returned	Return Rate
Castlepoint	50	23	46%
Eastbourne	100	50	50%
Lyall Bay	100	45	45%
Raumati	300	167	55.70%
Riversdale	50	17	34%
Seatoun	100	48	48%
Te Horo	100	40	40%

3. Methodology

The figures within the following sections present the unmodified data from Johnston et al. (2003) sorted according to a key response for each question. Communities in the Wellington Region have been grouped at the left of each chart. Where the response for 'Wellington Region' or the 'rest of New Zealand' is referred to, it has been calculated as the average of all of the communities' responses within either the 'Wellington Region' or 'rest of New Zealand' grouping.

4. Demographics

The graphs depicting demographic data of the respondents are located in Appendix A. Respondents from the Wellington Region were split 46% males and 54% females, exactly the reverse of the NZ ratio of respondents (54% male, 46% female). Riversdale was the only community in Wellington where more respondents were male while Lyall Bay respondents were 68% female.

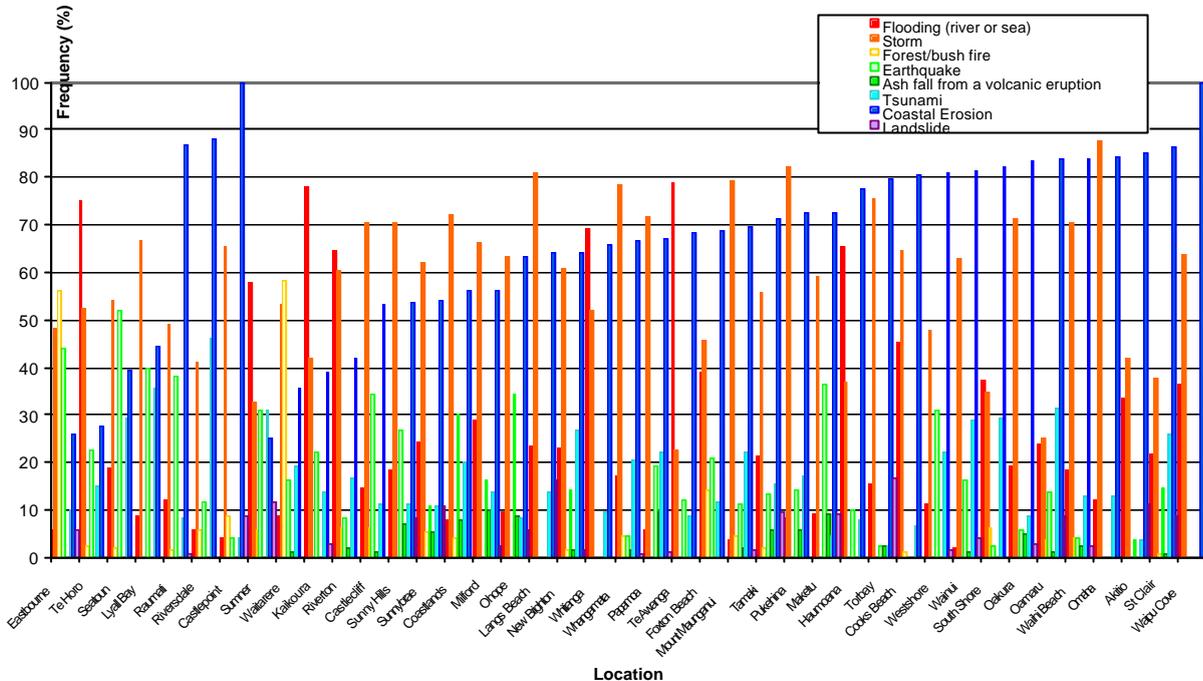

Nationally, on average nearly half (47%) of respondents were aged 50 to 60 years old, with a further 18% between 60 and 70 years old.

Nationally, an average of 77% of respondents stated that they owned and lived in the house where the survey was delivered. An average of 12% rented the house where the survey was delivered. Castlepoint had the lowest rate of home ownership, at 39.1%, with 26.1% of respondents saying that they were visiting and owned a home elsewhere.

5. General Hazards

This section presents the results of questions on a number of natural hazards. The questions focus on when a particular hazard is likely to affect their area and if they have ever experienced a natural hazard such as a tsunami or an earthquake.

Figure 2: The two natural hazards that respondents think are most likely to affect their community

Respondents were asked to name the two natural hazards that they thought were most likely to affect their community, the results are shown in Figure 2. Coastal erosion was the first choice for both the Wellington region (59% on average) and the rest of New Zealand (68%). 100% of Castlepoint respondents named coastal erosion.

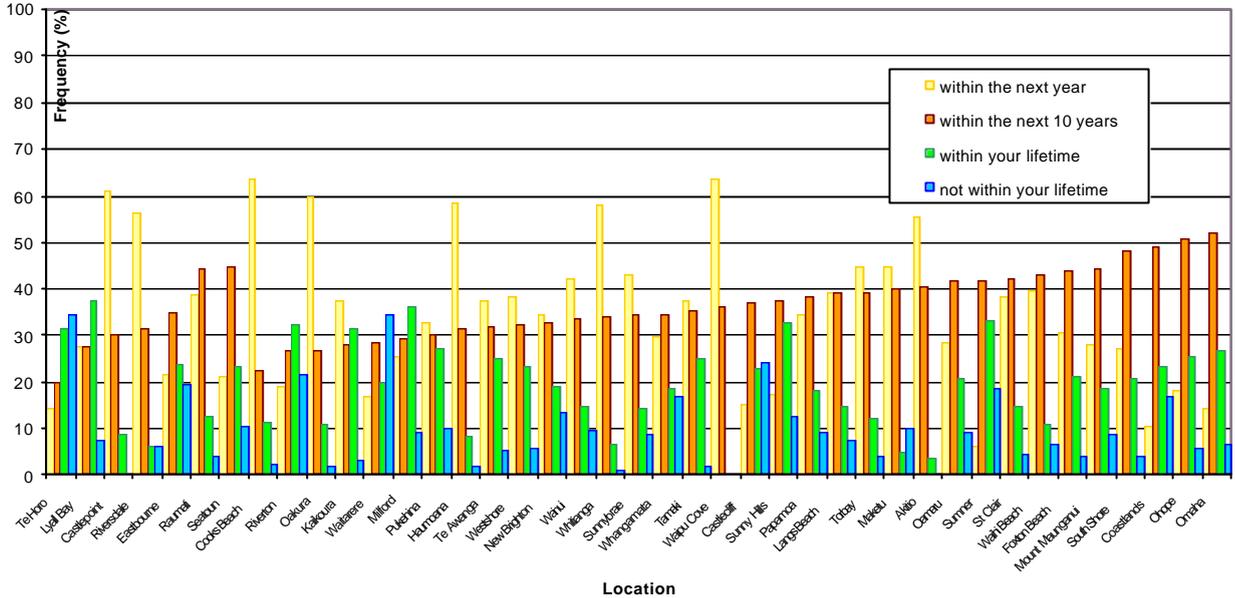

Storm with high winds was the next choice for both groups. Not surprisingly, those from the Wellington Region chose earthquake (30% on average) as the next most likely hazard, while the rest of New Zealand chose flooding (28%). Earthquake was fourth for the rest of New Zealand (14%), less than half the average for the Wellington Region's communities.

Three quarters of people from Te Horo were most concerned about flooding, significantly higher than the Wellington Region average of 19%.

Tsunami was the fifth hazard chosen by both the Wellington Region group of communities and the rest of New Zealand.

The survey asked people when they thought each of eight different hazards were likely to affect their area, if at all. The hazards given were flooding (river or sea), storm or cyclone with high winds, forest or bush fire, earthquake, volcanic ash fall, tsunami, coastal erosion and landslide. Respondents were then asked to select from four time options: 'within the next year', 'within the next ten years', 'within your lifetime' or 'not within your lifetime'. The responses for each hazard are presented in separate graphs.

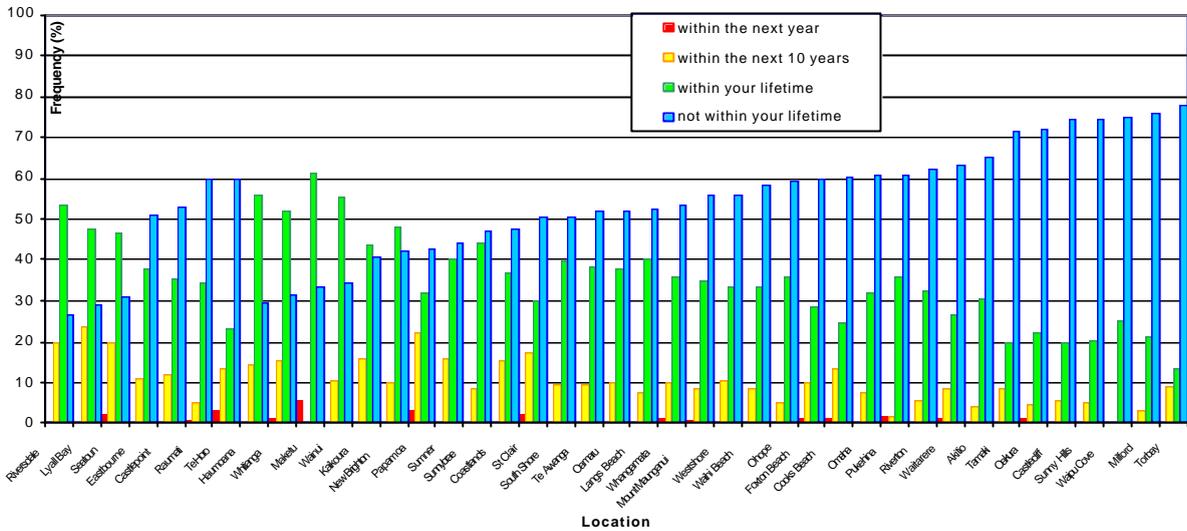

Figure 3: Time period in which respondents think coastal erosion is likely to affect their community

Nationally, **coastal erosion** was the hazard that most respondents chose as likely to affect their area in the future. Reinforcing this is the fact that an average of 71% of respondents believed that coastal erosion is likely to affect their area ‘within the next ten years’ (36%) or ‘within the next year’ (35%).

Castlepoint and Riversdale respondents believe that coastal erosion is likely to affect their area ‘within the next year’ (61% and 56% respectively). Raumati on 39% had a relatively high value for ‘within the next year’, not surprising given the current coastal erosion situation there.

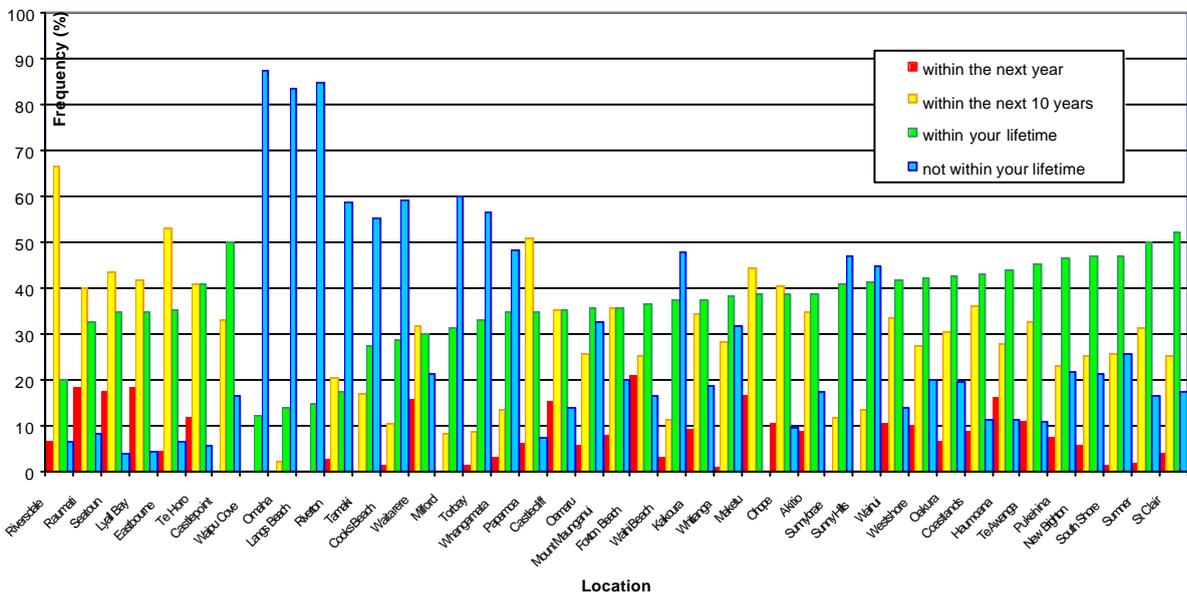

Figure 4: Time period in which respondents think a tsunami is likely to affect their community

With respect to **tsunami**, an average of 44% of respondents from the Wellington Region locations and 56% of those from the rest of New Zealand thought that tsunami would not affect their area within their lifetime.

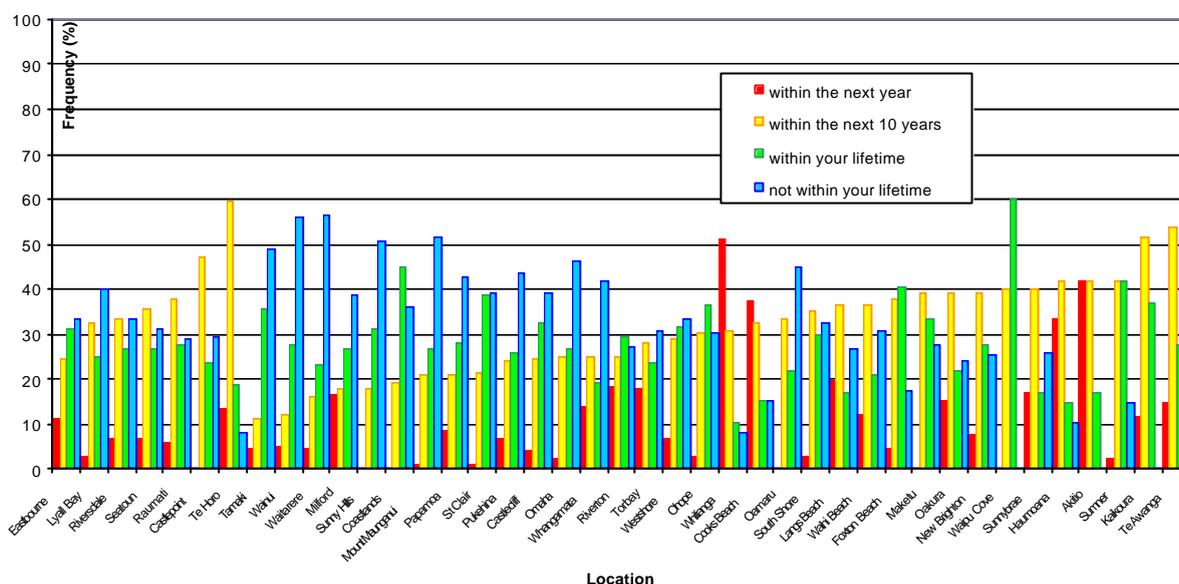

Riversdale, Lyall Bay and Seatoun respondents favoured the ‘within your lifetime’ option. Interestingly, 53% of respondents from Castlepoint, one of the only locations in New Zealand where there are tsunami warning signs, thought that tsunami would not affect the area within their lifetime compared with 35% who thought within the next year.

Figure 5: Time period in which respondents think an earthquake is likely to affect their community

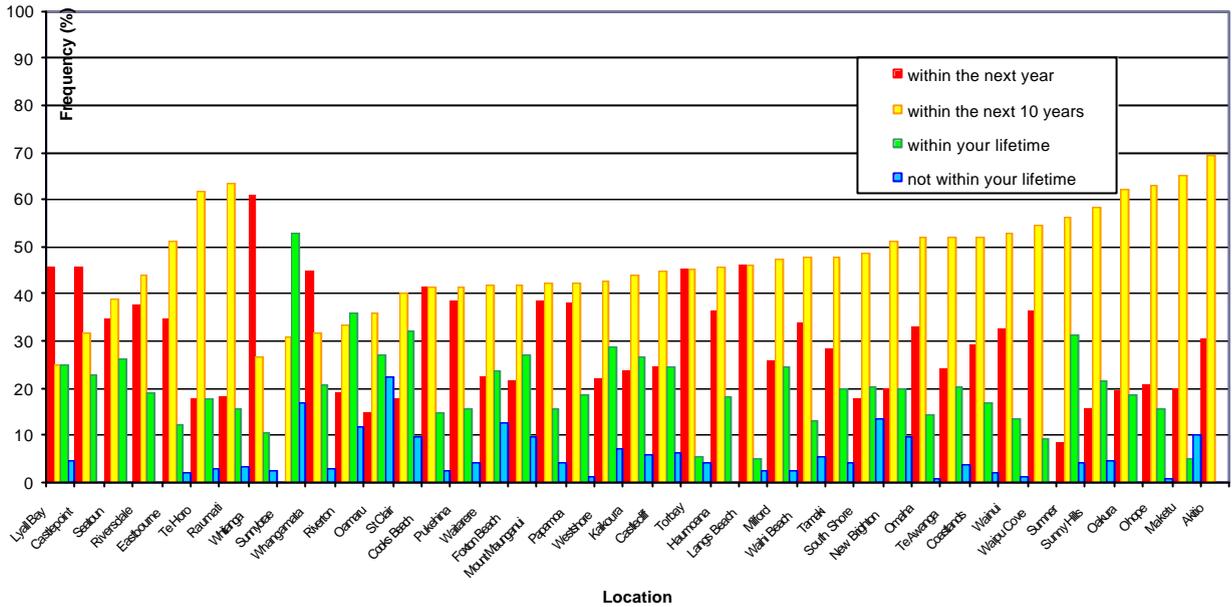

When asked when they thought an **earthquake** would affect their area, an average of 46% of those from the Wellington Region communities chose ‘within the next ten years’ compared with 24.3% of the rest of New Zealand. An average of 36% of both groups responded ‘within your lifetime’. The most interesting result is that an average of only 8% of respondents from the Wellington Region thought that an earthquake would not affect their area within their lifetime compared with a figure of 33% for the rest of New Zealand.

Figure 6: Time period in which respondents think flooding (river or sea) is likely to affect their community

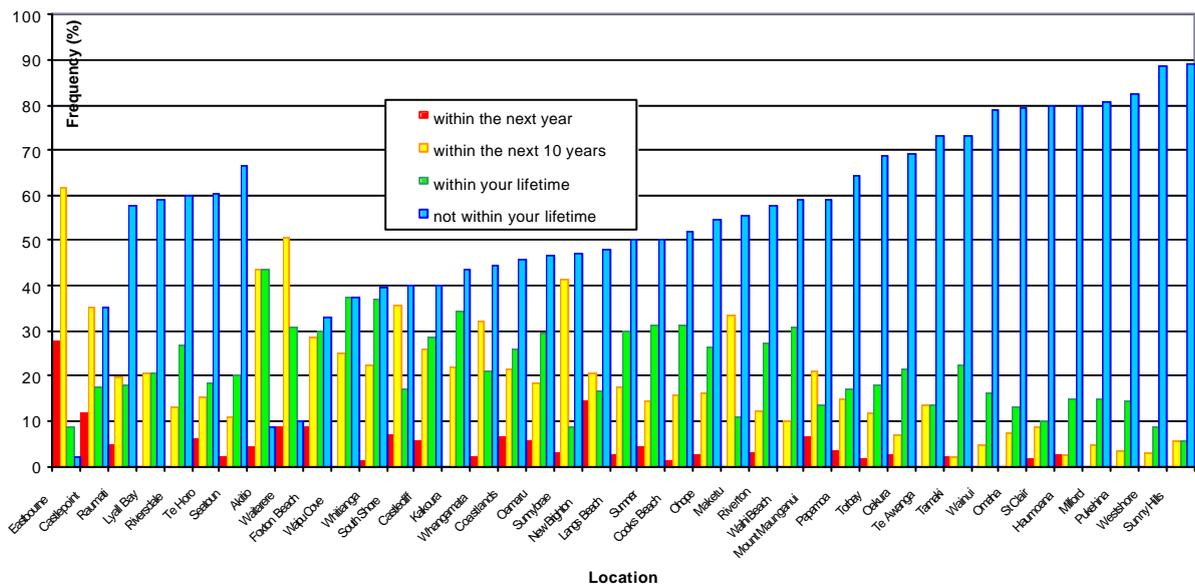

For **flooding** the preferred option for respondents from the Wellington Region was ‘within the next ten years’ (39% on average) followed by ‘not within your lifetime’ (29% on average), ‘within your lifetime’ (26% on average) and ‘within the next year’ (7%). For the rest of New Zealand the pattern was less clear. On average 30% of respondents selected either ‘within the next 10 years’ or ‘not within your lifetime’ and 28% selected ‘within your lifetime’. This pattern reflects the varied nature of the coastal communities questioned.

Figure 7: Time period in which respondents think a storm is likely to affect their community

Respondents answered that **storm or cyclone with high winds** was most likely to affect their area within the next ten years (an average of 47% nationally). The next choice was ‘within the next year’ (29%). This indicates that people think that storm or cyclone with high winds is going to affect their area sooner rather than later. Lyall Bay and Castlepoint indicated that they thought storm or cyclone would affect their area within the next year (both 45.5%). Both of these communities are routinely exposed to storms with very high winds.

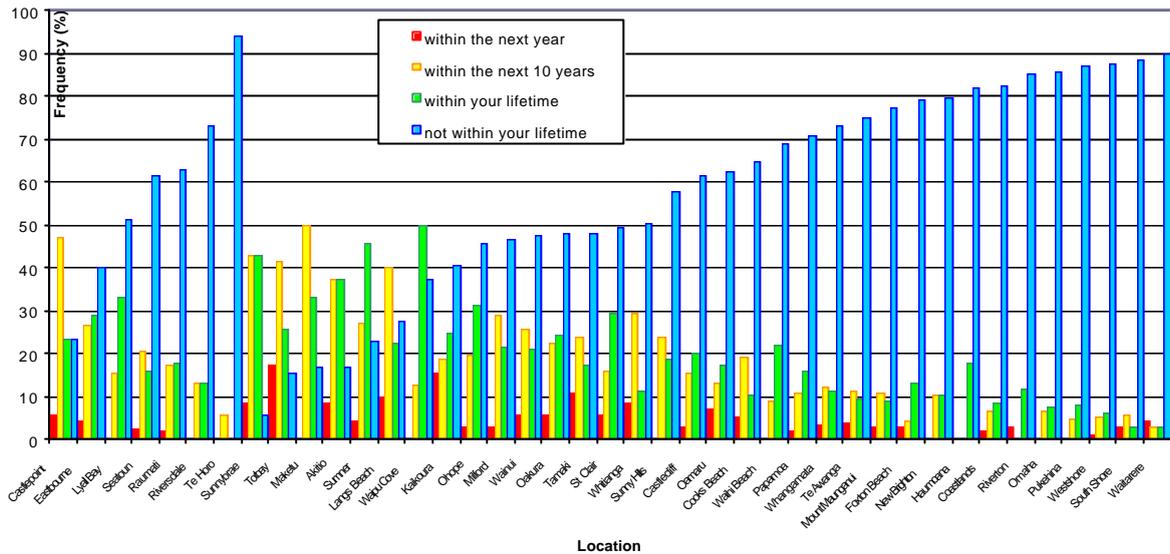

Figure 8: Time period in which respondents think a forest or bush fire is likely to affect their community

An average of 55% of respondents in each community nationally indicated that they did not believe that **forest or bush fire** would affect their area within their lifetime. Nationally this was followed by ‘within your lifetime’ (22%). Respondents from the Wellington region favoured ‘within the next ten years’ as the second option (25%). This

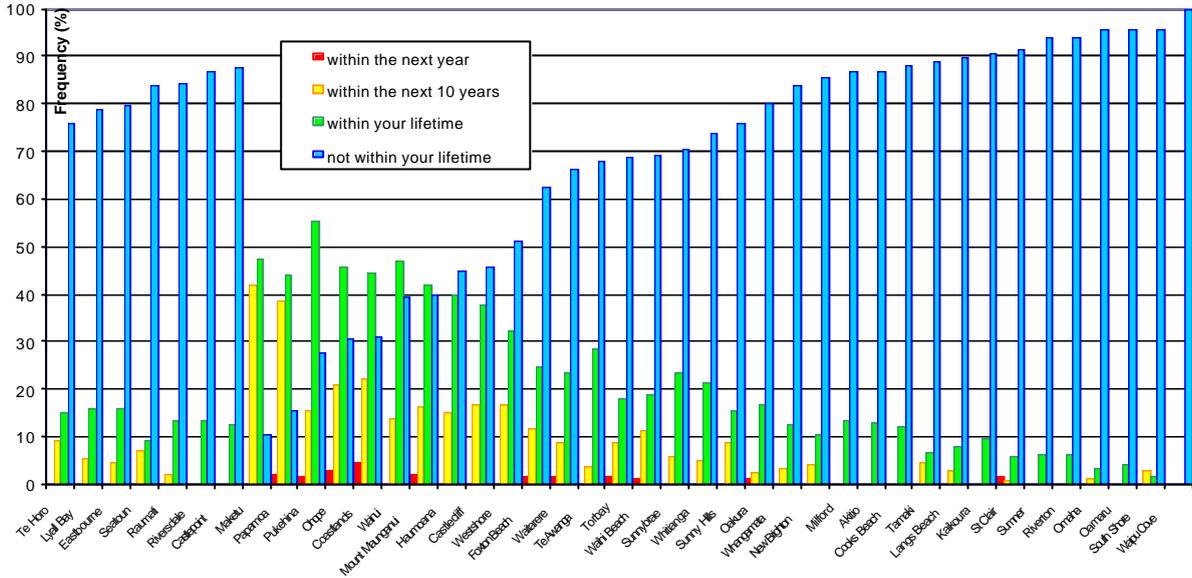

can be explained by the fact that 62% of Eastbourne and 35% of Castlepoint respondents thought that forest or bush fire would affect them within the next ten years. Eastbourne's high value is due to forest and bush fires occurring fairly regularly in the bush of the East Harbour Hills, just behind Eastbourne itself.

Figure 9: Time period in which respondents think a landslide is likely to affect their community

Nationally, on average, 58% of respondents thought that a **landslide** would not occur within their lifetime. Values for the Wellington Region and the rest of New Zealand for each option were very similar. On average only 4% of respondents thought landslide would affect them within the next year. Castlepoint's value of 47% for within the next ten years was well above the national average of 18%. The flat landscape of Te Horo accounts for the fact that 94% of respondents there thought landslide would not affect their area within their lifetime.

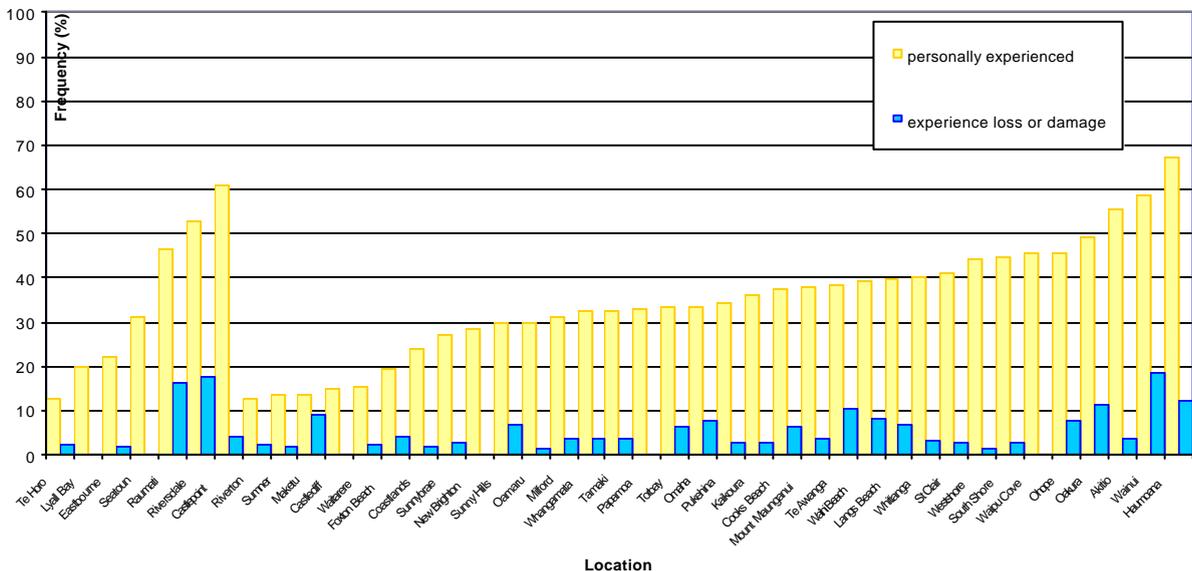

Figure 10: Time period in which respondents think volcanic ash fall is likely to affect their community

A clear trend is shown with **volcanic ash fall**. On average approximately 90% of all respondents selected either ‘not within your lifetime’ (71%) or ‘within your lifetime’ (20%). The communities of the Wellington Region are less likely to think volcanic ash fall will affect the Region, with an average of 82% of respondents from each of the Wellington locations selecting ‘not within your lifetime’, compared with 69% for the rest of New Zealand.

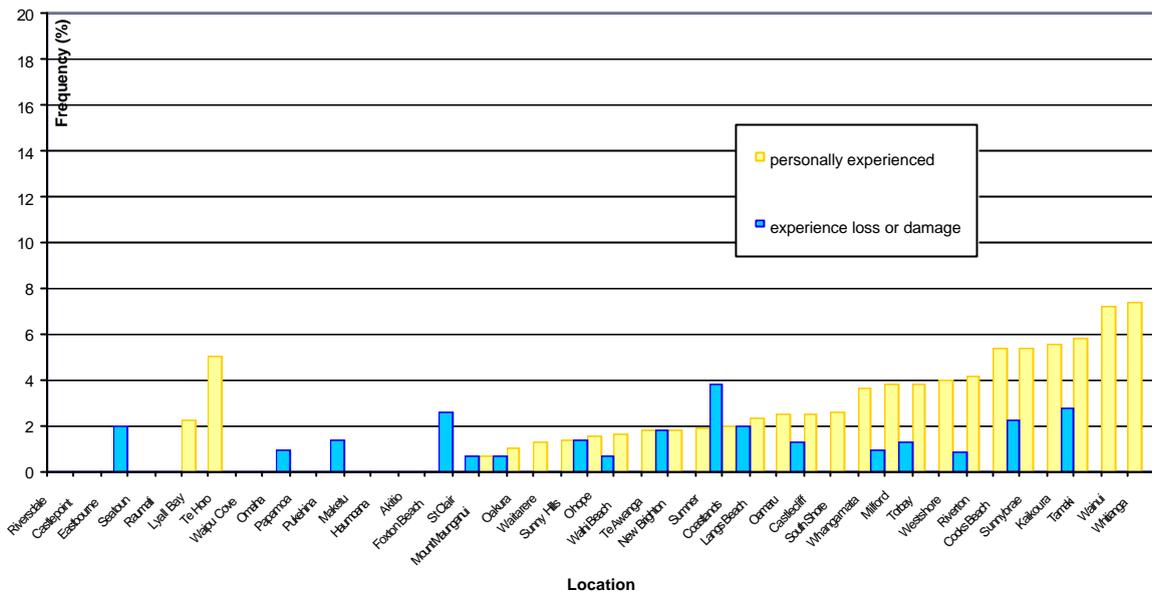

Respondents were then asked if they had personally **experienced** any of the eight specific hazards and if so did they experience any loss or damage as a result. Figures 11 through 18 present the results for each hazard.

Figure 11: Proportion of respondents who have experienced coastal erosion and/or experienced damage as a result

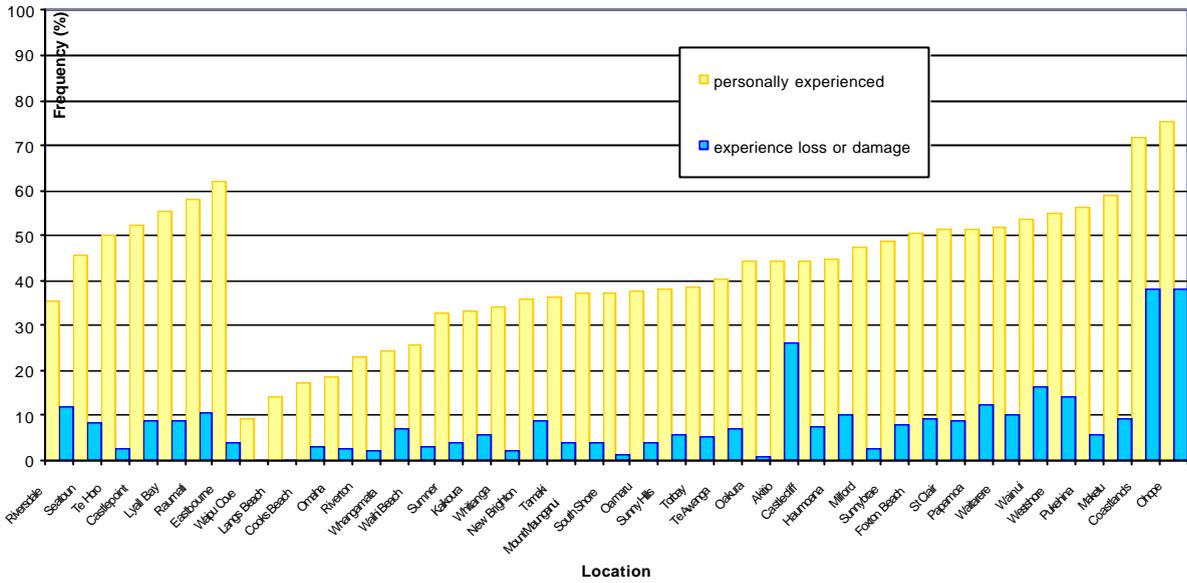

The level of experience of **coastal erosion** was the same for both the Wellington region and the rest of New Zealand (35% on average). Damage or loss averaged 5% nationally. Riversdale (52.9%) and Castlepoint (60.9%) each had high experience but 16.2% and 4.3% damage respectively.

Figure 12: Proportion of respondents who have experienced tsunami and/or experienced damage as a result

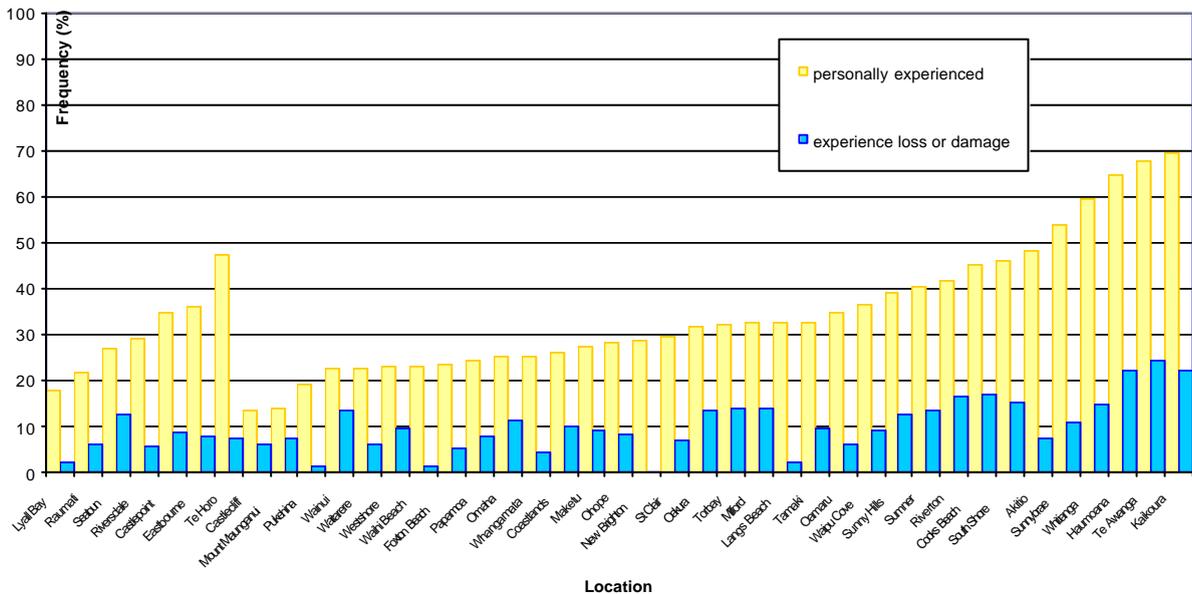

The national average for people who had experienced **tsunami** was 2.2%, with 0.7% experiencing loss or damage. Lyall Bay and Te Horo were the only Wellington where people experienced tsunami. Lyall Bay was affected by the 1960 tsunami but the Te Horo result is unexpected. Eastbourne, Omaha, Pukehina and Foxton Beach each had 0% experience yet some damage was registered. These were all at very low levels.

Figure 13: Proportion of respondents who have experienced an earthquake and/or experienced damage as a result

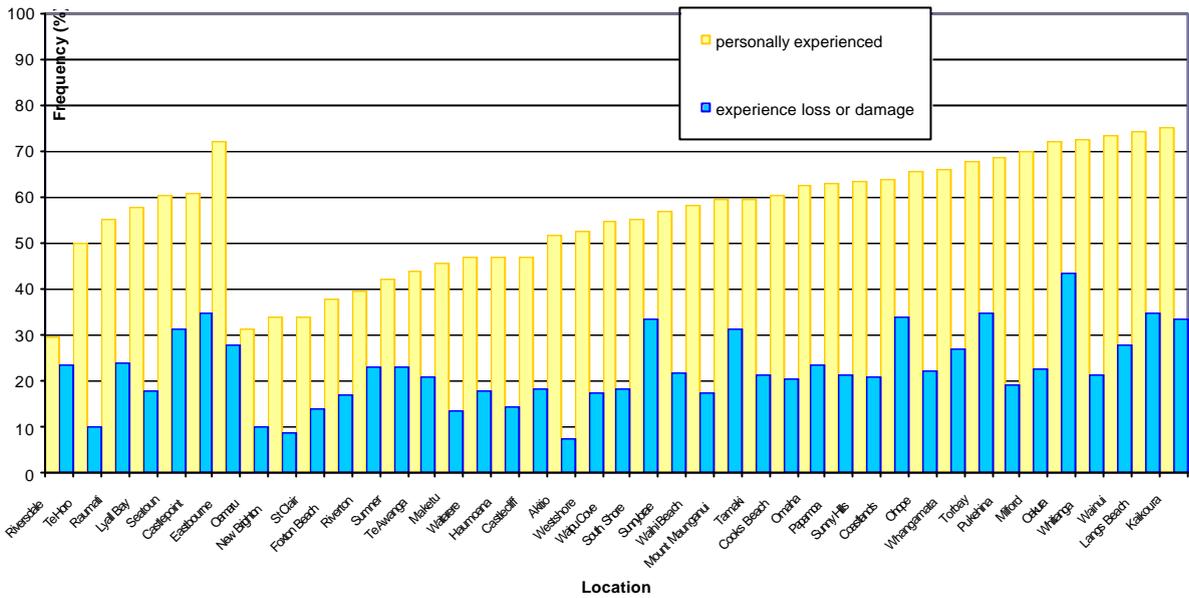

Again the Wellington Region scored higher than the rest of New Zealand for a question about **earthquakes**. An average of 51% of Wellington Region respondents had experienced an earthquake compared to 41% of the rest of the country. Damage or loss percentages were roughly equal (7.9% Wellington Region and 8.4% rest of New Zealand).

Figure 14: Proportion of respondents who have experienced flooding (river or sea) and/or experienced damages as a result

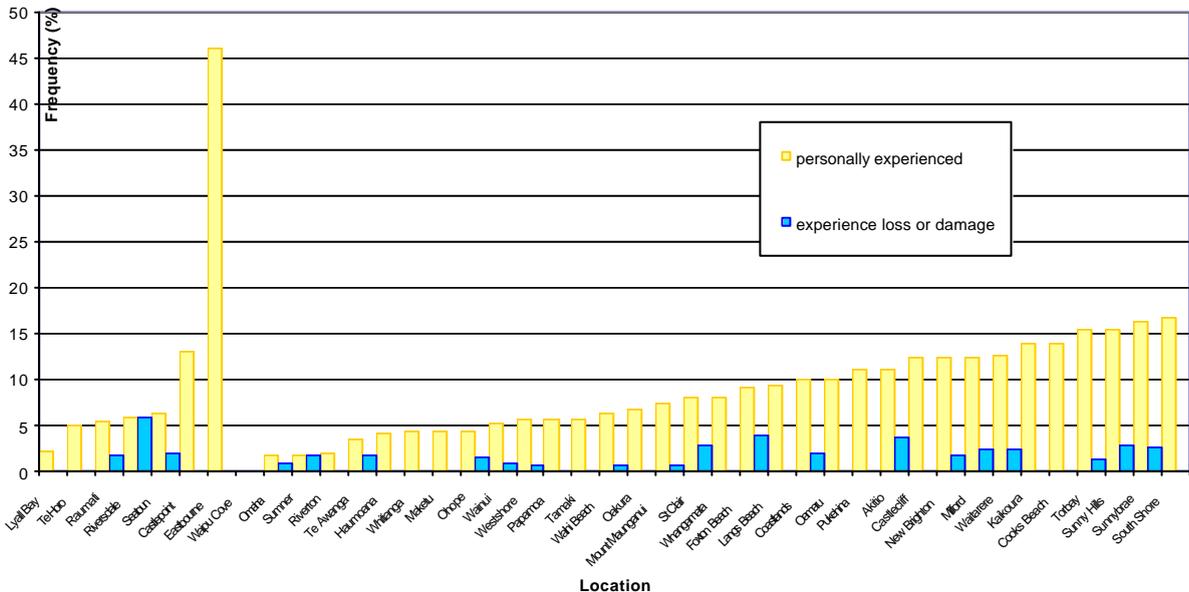

Nationally an average of 34% of respondents had experienced **flooding** with an average of 10% experiencing loss or damage. The figures for the Wellington Region and rest of New Zealand were very similar. Te Horo's 47.5% experience places it in the upper quartile of respondents who have experienced flooding but the 7.5% damage or loss value is below the national average.

Figure 15: Proportion of respondents who have experienced storm with high winds and/or experienced damage as a result

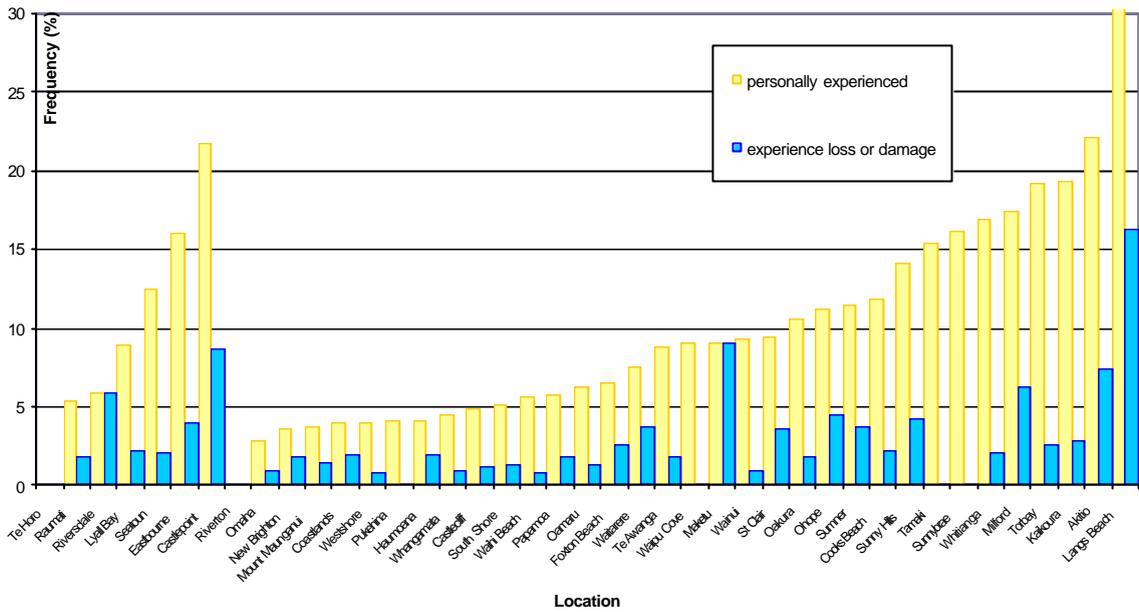

The national average for those who have personally experienced storm or cyclone with high winds is 56%. An average of 23% of all respondents had experienced damage or loss. Castlepoint had the third highest experience of loss or damage (34%), after Oakura and Langs Beach. This result can be easily explained as Castlepoint is often exposed to high winds.

Figure 16: Proportion of respondents who have experienced forest or bush fire and/or experienced damage as a result

Forest or bush fire had been experienced by an average of 9% of respondents nationally, with damage or loss standing at 1%. Eastbourne recorded the highest level of experience with 46% although no damage resulted. This explains why 62% of Eastbourne residents thought that forest or bush fire could affect them within the next ten years. For Riversdale the level of experience was equal to damage or loss.

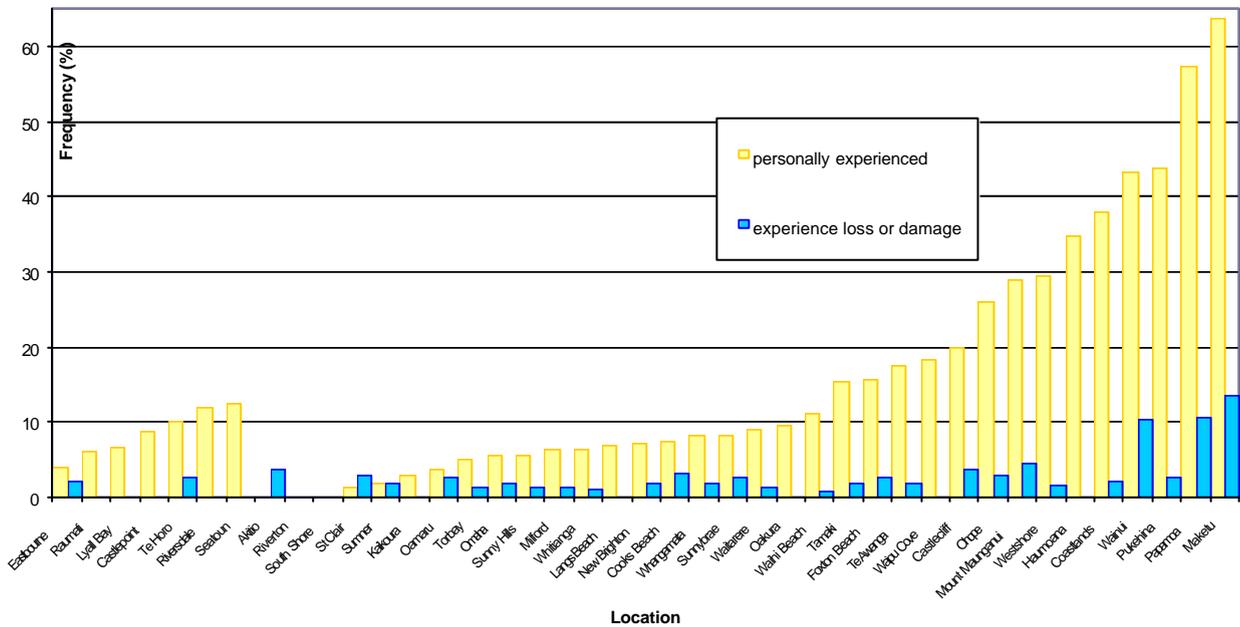

Figure 17: Proportion of respondents who have experienced landslide and/or experienced damage as a result

National experience and damage from landslide was 10% and 2.9% respectively. In

Castlepoint 22% had experienced a landslide, and the damage level of 8% was second only to Wainui.

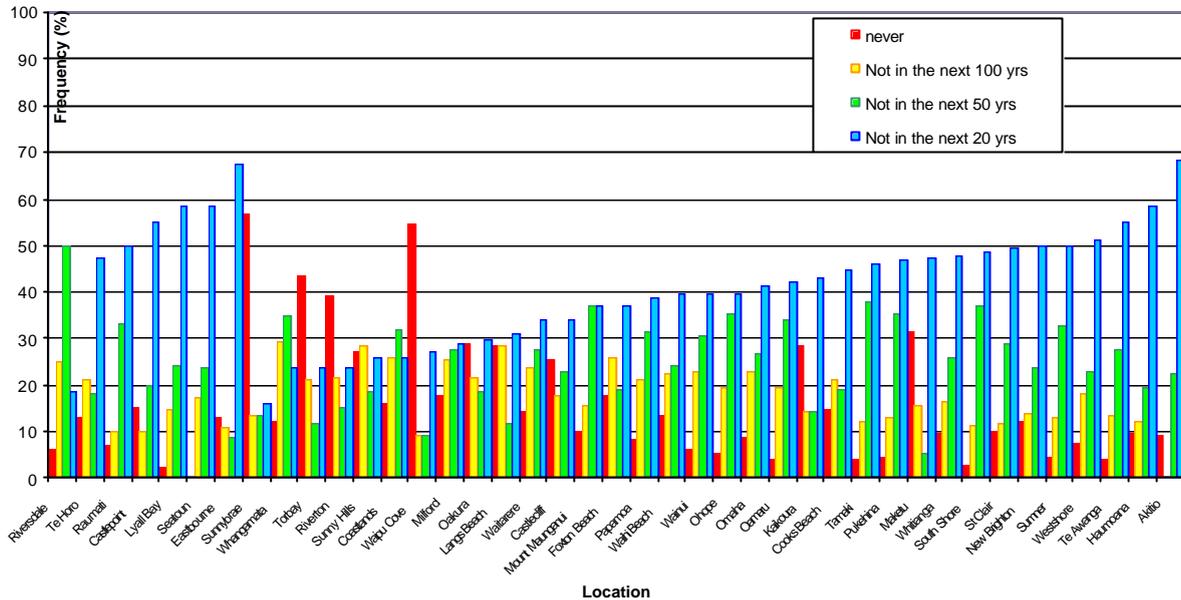

Figure 18: Proportion of respondents who have experienced volcanic ash fall and/or experienced damage as a result

Those places where 20% or more respondents had experienced volcanic ashfall, such as Mount Maunganui and Papamoa are located on the East Coast, in close proximity to volcanic features such as (does that create ash that far away? We should check – or get D & G to review). Only 9% on average of Wellington Region respondents had experienced volcanic ashfall, compared to a figure of 16% for the rest of New Zealand. The Wellington Region average for damage was less than one percent compared to 2.6% for the rest of New Zealand.

6. Sea level rise and Global warming

Figure 19: Time period in which respondents think sea level rise caused by global warming will affect their property

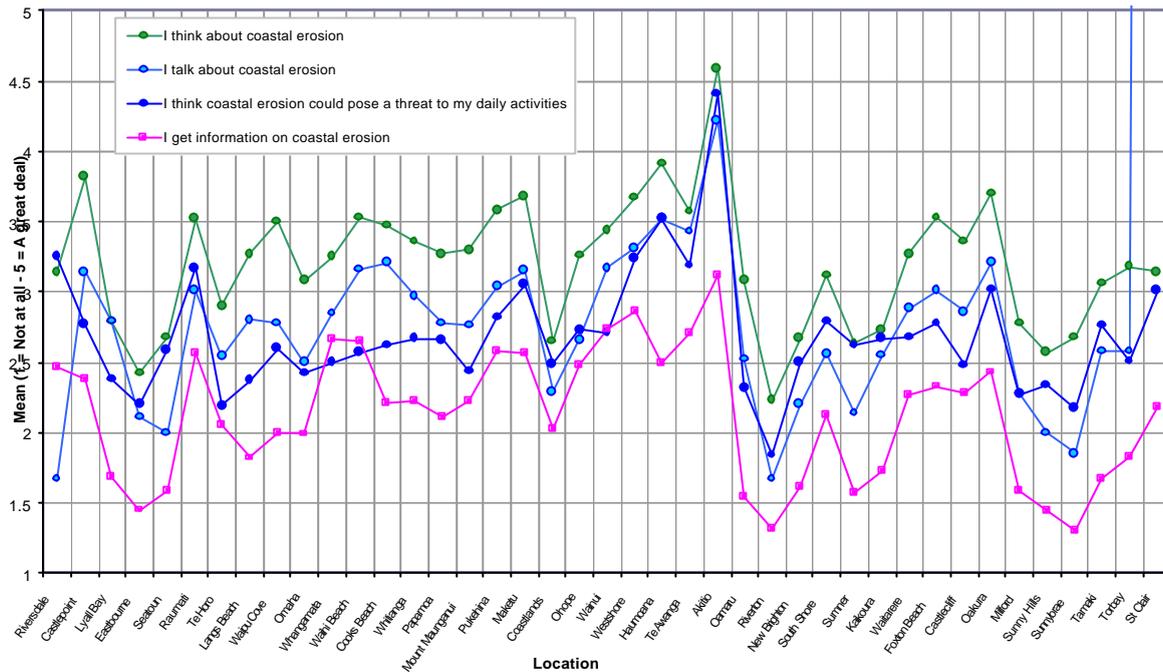

Sea level rise and global warming are becoming more well known issues and this is reflected in the results for this question. When asked when they believed sea level rise caused by global warming was expected to affect their property, an average of 51% of Wellington Region and 40% of the rest of New Zealand respondents chose the earliest option of 'not within the next 20 years'. Respondents from the Wellington Region were also less likely (an average of 8%) to chose the 'never' option, compared with 17% for the rest of New Zealand. This indicates that respondents from the Wellington Region believe that sea level rise caused by global warming will happen sooner rather than later. Of note is the fact that 50% of Riversdale residents selected 'not in the next 50 years' and 25% 'not in the next 100 years', going against the trend for the other communities.

7. Coastal Erosion

7.1 Hazard knowledge

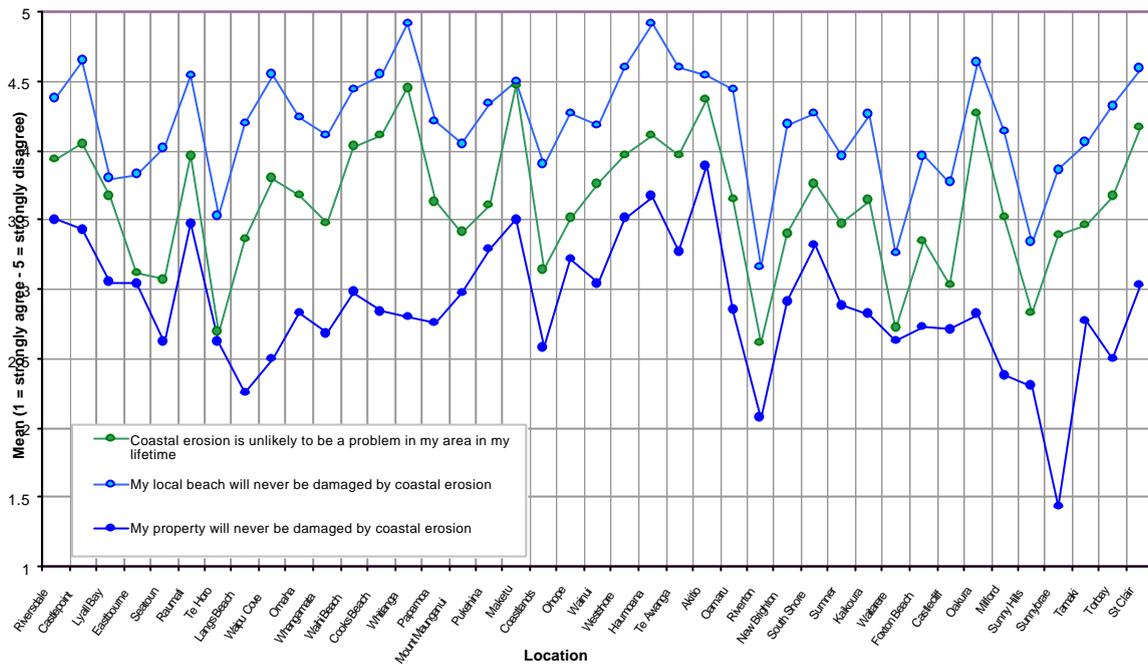

Respondents were asked to what extent they agreed with a number of statements about coastal erosion. The choices ranged from 1: not at all to 5: a great deal. A copy of the questionnaire is in Appendix B.

Figure 20a: The extent to which respondents agree with a number of coastal erosion related statements

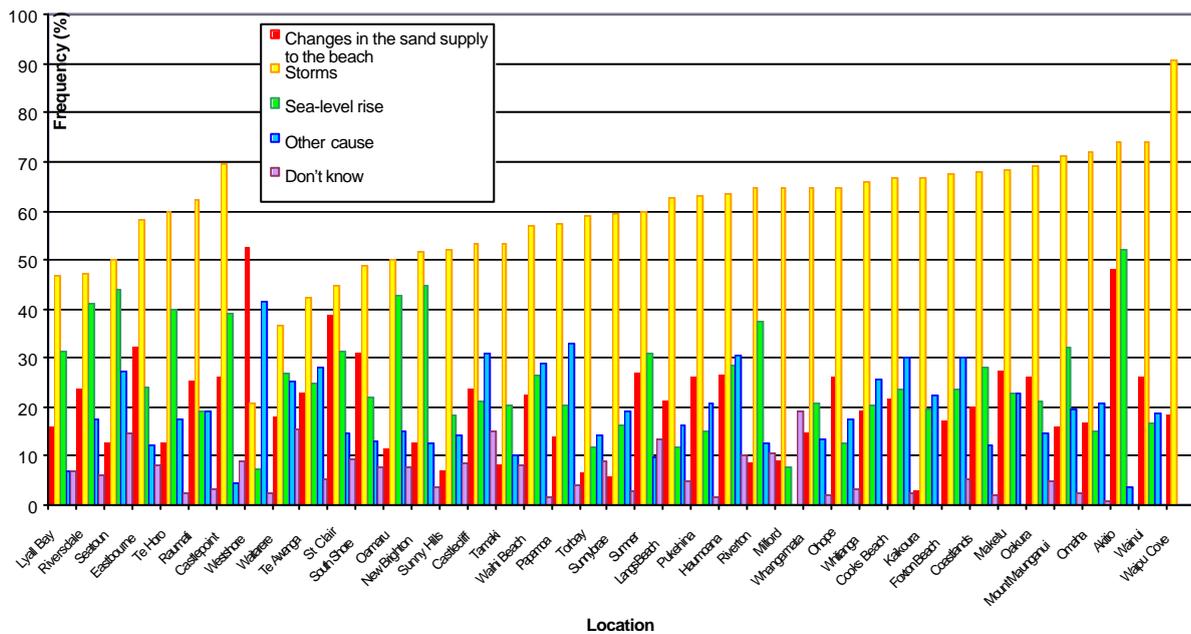

The results in Figure 20a show that in general people think about coastal erosion more than they talk about it. They are less likely to think that coastal erosion could pose a threat to their daily activities and even less likely to get information on coastal erosion. Riversdale, Castlepoint and Raumati are more likely than the rest of the Wellington Region to get information, while Castlepoint and Raumati think and talk about coastal erosion more than the rest of the Region. ‘Get information’ should be interpreted as either seek or receive information, it was left to respondents to decide what was meant by this statement.

Figure 20b: The extent to which respondents agree with a number of coastal erosion related statements

Generally respondents strongly disagreed with the statement that their local beach would never be damaged by coastal erosion. Riversdale, Castlepoint and Raumati had particularly high levels of disagreement. This is to be expected given that each of these places has had to deal with a coastal erosion problem. Respondents also disagreed that coastal erosion is unlikely to be a problem in their lifetime. The response was neutral regarding whether their property would ever be damaged by coastal erosion.

Figure 21: The causes of coastal erosion

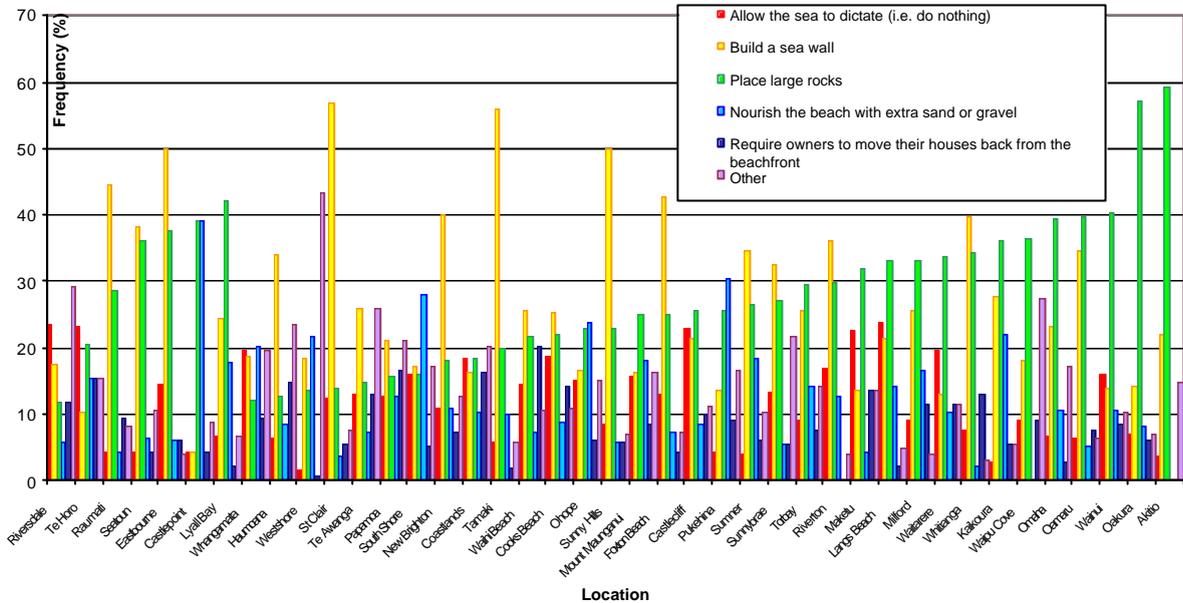

When asked what the main cause of coastal erosion was, on average 56% of Wellington Region respondents and 60% of the rest of New Zealand selected storms. Sea level rise was the next option, selected by an average of 34% of the Wellington Region respondents, and 23% for the rest of the country. This, combined with the higher result

from Figure 19 indicates that respondents from the Wellington Region were more aware or more concerned with sea level rise than the rest of the country.

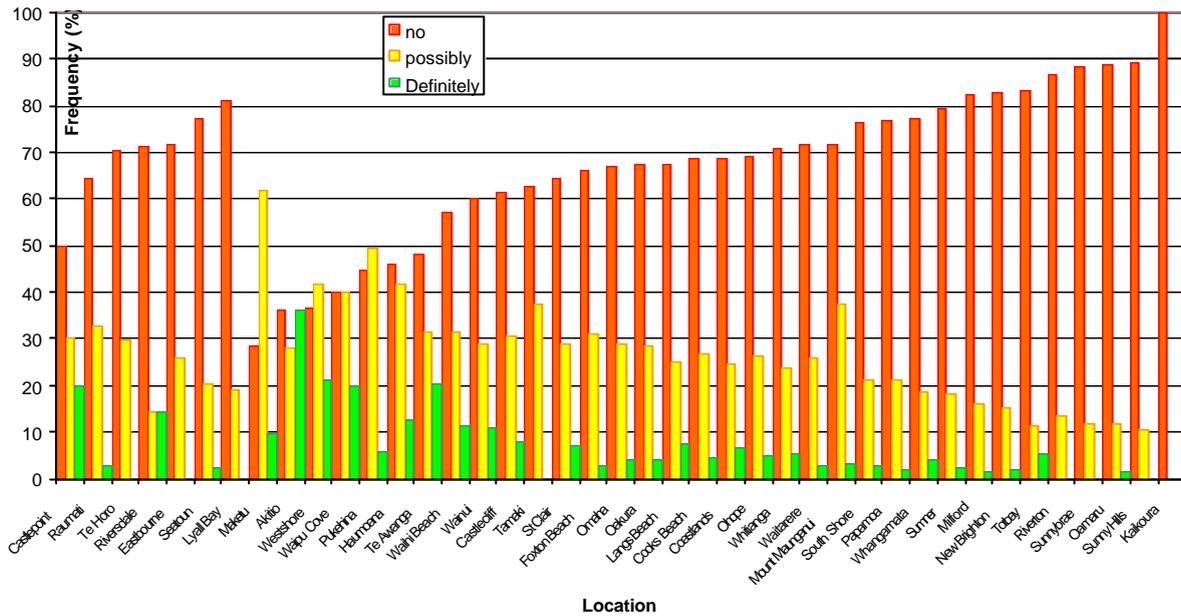

7.2 Erosion defence and Community involvement

Figure 22: Coastal erosion defence methods that respondents most agree with

Respondents were asked to nominate the coastal defence for severely eroding coastal properties that they most approve of. Placing large rocks and building a sea wall were almost equivalent nationally in their approval figures (on average 27% and 28% respectively). Raumati, Seatoun and Eastbourne favoured building a sea wall while Lyall Bay and Castlepoint favoured placing large rocks. This shows that each community tended to favour the approach that has been used at or near their area. Riversdale and Te Horo both had mixed responses with 23.5% from Riversdale and 23.1% from Te Horo favouring allowing the sea to dictate.

Figure 23: Proportion of residents who intend joining a group to discuss coastal erosion and methods for protecting against it

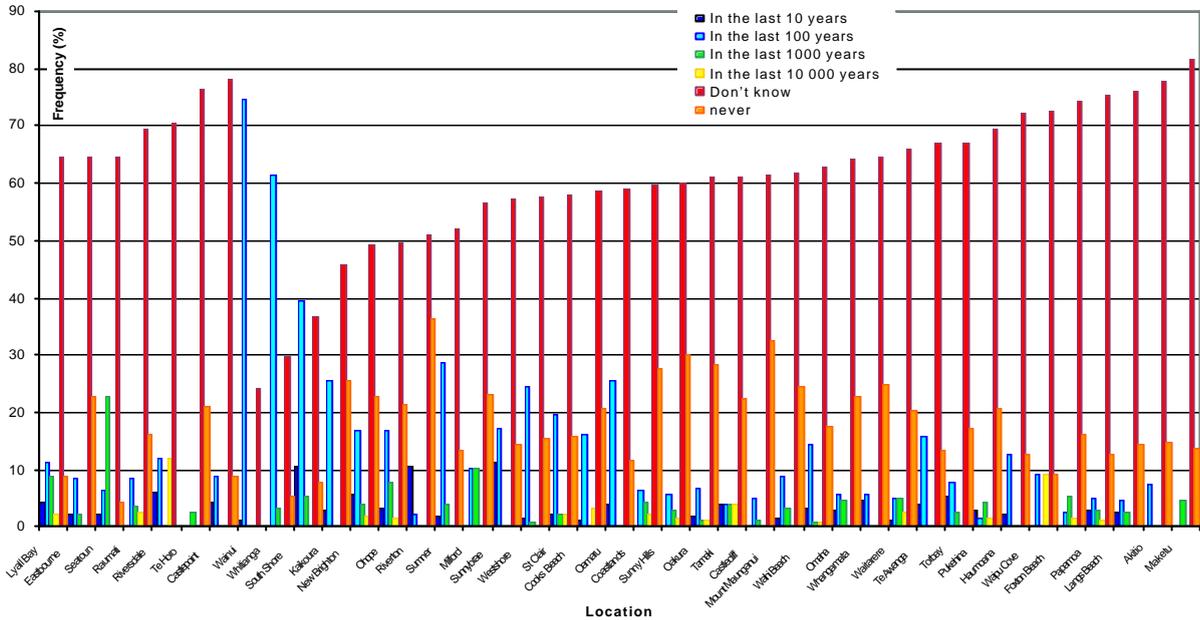

This question asked if the respondent intended to become involved with a local group to discuss coastal erosion and methods for protecting against it. The national response showed that on average two thirds or more of respondents will not, with a quarter saying possibly. In Castlepoint 20% said definitely and 14% in Riversdale said the same. Nationally an average of only 5% of respondents chose definitely. The Riversdale response is particularly interesting because in the previous question respondents favoured doing nothing to protect against coastal erosion.

8. Tsunami

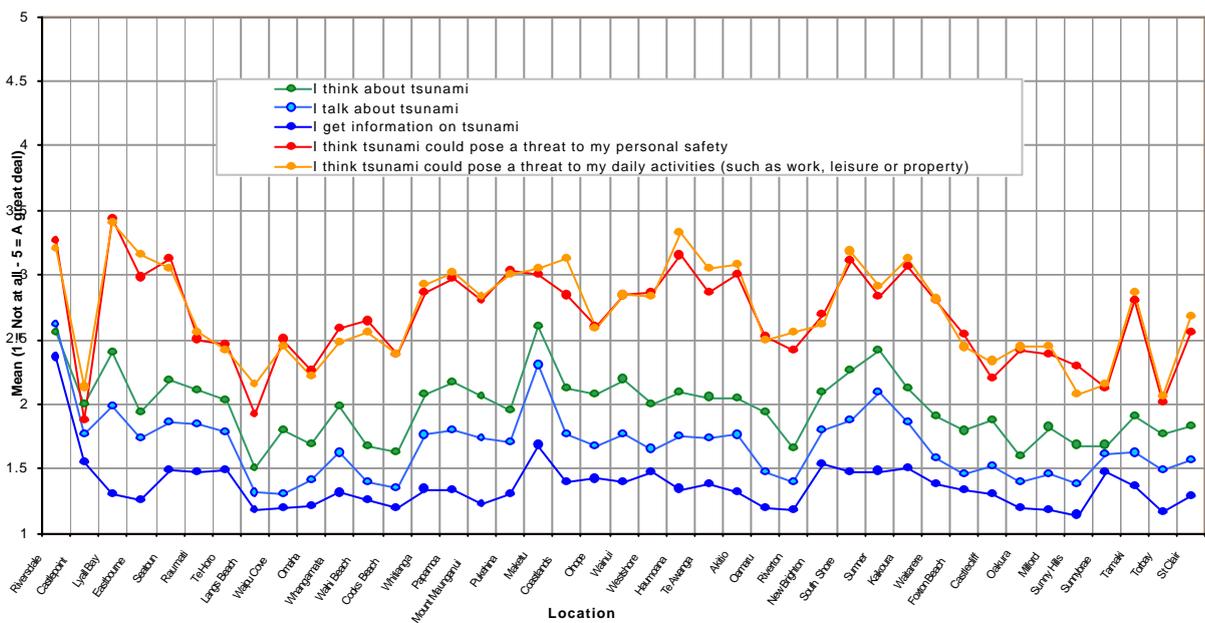

8.1 Hazard knowledge

Figure 24: Time period in which respondents think the last tsunami affected their area

Respondents were asked when the last tsunami that affected their area occurred. An average of around 70% of Wellington Region respondents and 60% of the rest of New Zealand did not know. The next choice was never.

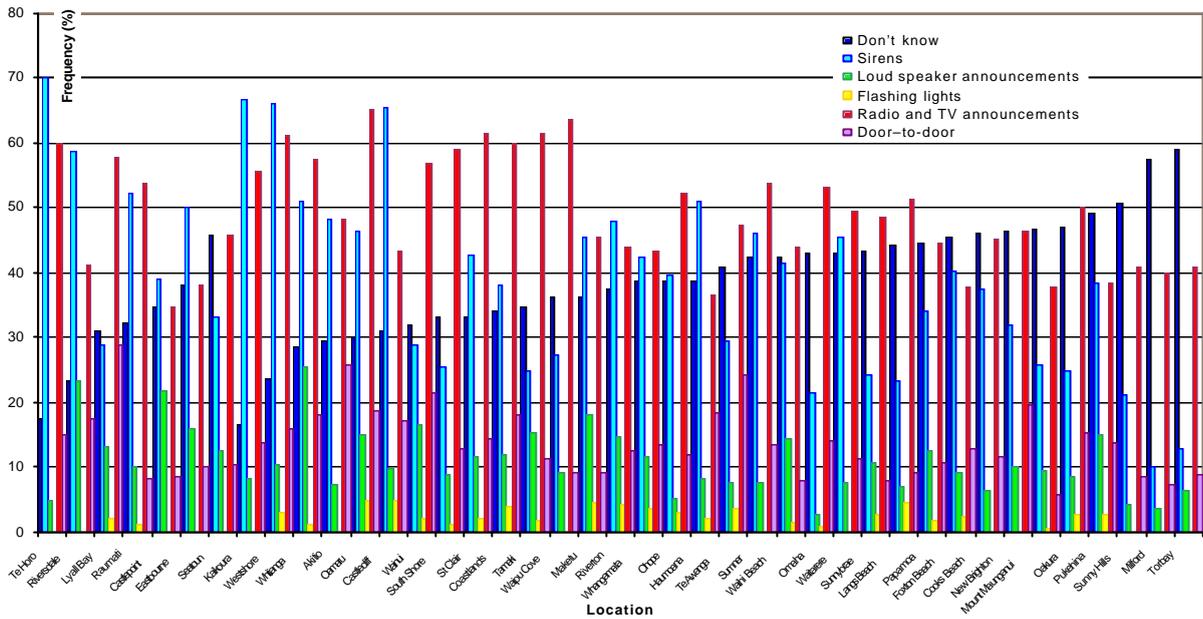

Figure 25a: The extent to which respondents agree with a number of tsunami related statements

A similar question set to that for coastal erosion asked respondents what extent they agreed with a number of statements. Much like the response to coastal erosion, it was found that people are least likely to get information. While respondents appear to think and talk about tsunami less than coastal erosion, they do tend to believe to a certain

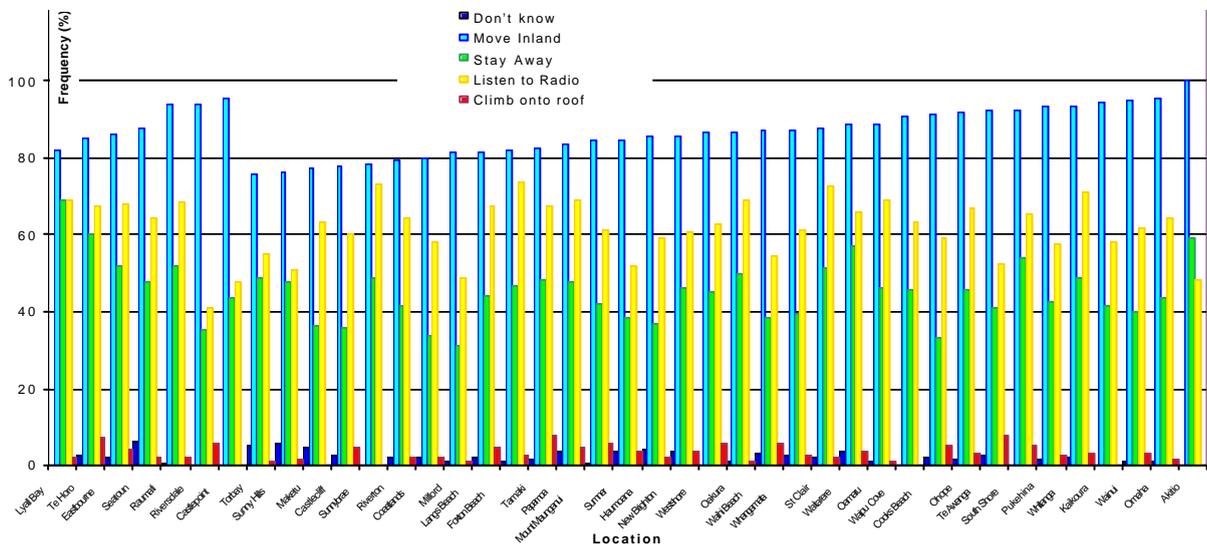

8.2 The tsunami warning system

Figure 27: Components that respondents think make up the tsunami warning system

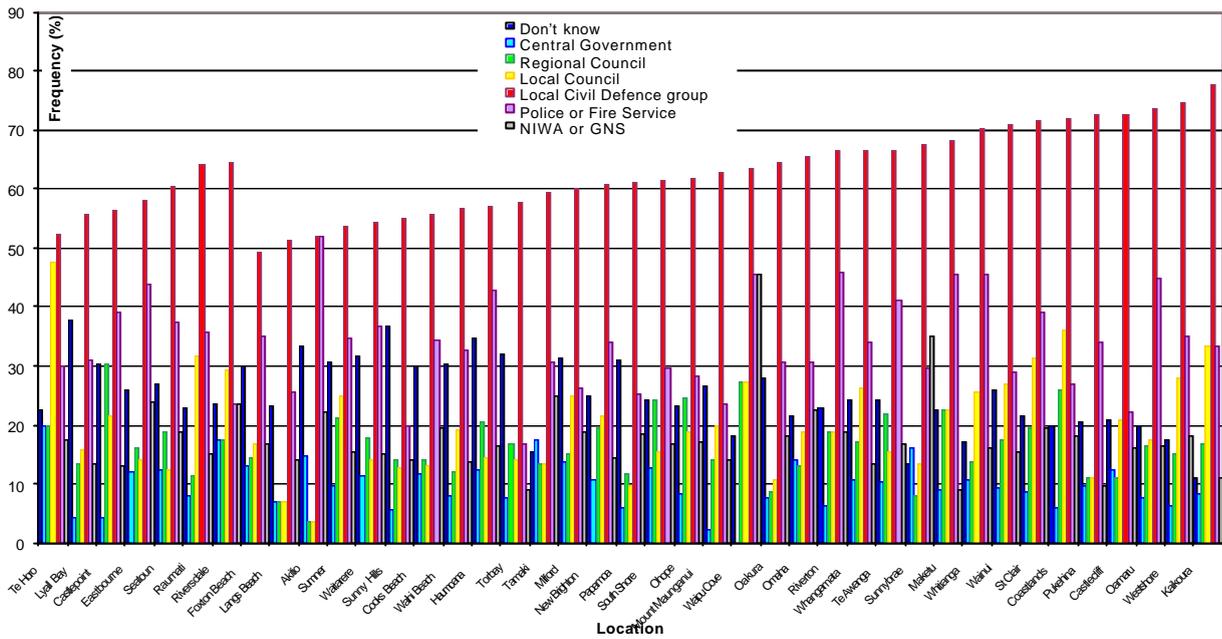

Knowledge of the New Zealand public tsunami warning system was tested by asking people what made up the system. Around 14% (on average) nationally did not know while more than 45% picked radio and TV announcements and then sirens.

Figure 28: The actions respondents would take in the event of a tsunami warning

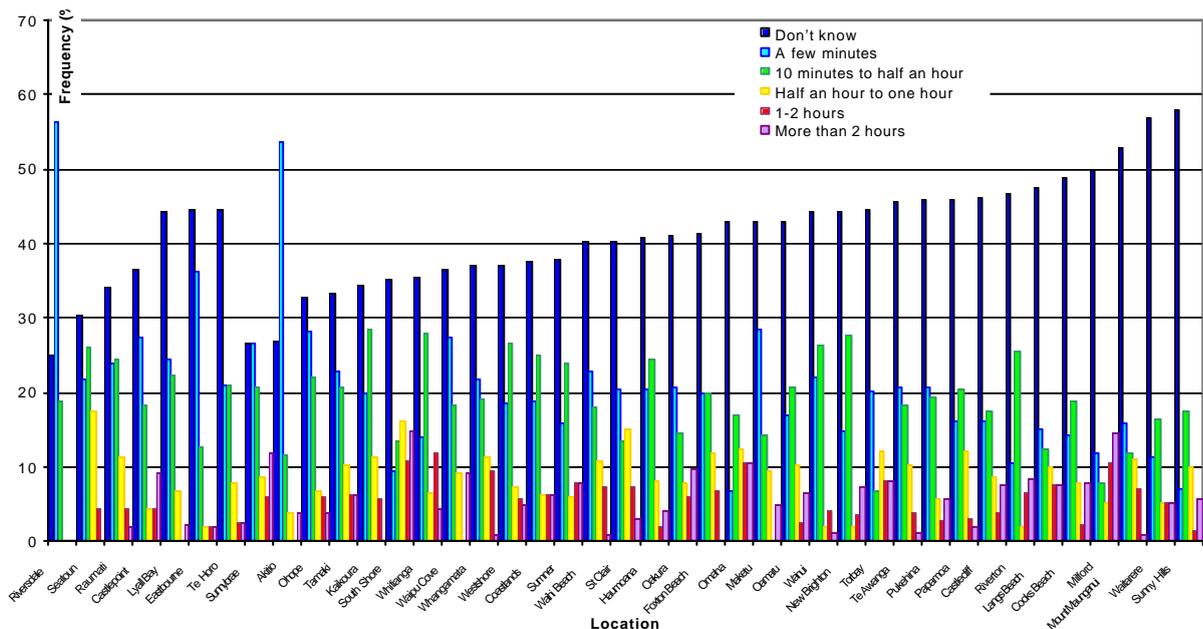

When asked what actions people would take in the event of a tsunami warning an average of 87% nationally said they would move inland. This was followed by an average of 62% saying they would listen to the radio and around half saying they would stay away. The Wellington Region matched the pattern for the rest of New Zealand.

Figure 29: The agency that respondents think is responsible for issuing tsunami warnings

Respondents were asked who they thought was responsible for issuing tsunami warnings. The response for the Wellington Region communities and the rest of New Zealand followed the same pattern. The choices were local Civil Defence (63% on average), followed by police/fire (34% on average) and then Local Council (20%). Interestingly around 17% of respondents on average thought that NIWA or GNS were responsible, roughly equal to the figures for Regional Council.

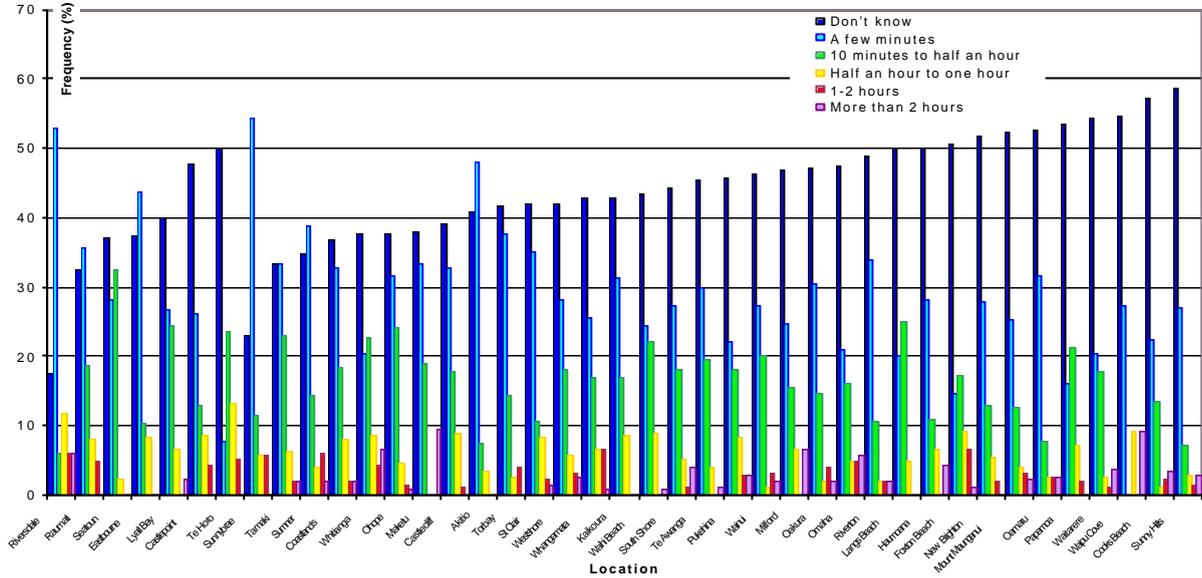

Figure 30: The length of time respondents think they have to move to safety following a tsunami warning

The most common response to the question regarding the amount of time people will have to move to safety after hearing the tsunami warning was 'don't know'. The next response was 'a few minutes' with an average of 30% of Wellington Region respondents, and 19% for the rest of the country. 56% of Riversdale respondents chose

‘a few minutes’. This could be a result of the tsunami warning signs on the beach. The next choice was ten minutes to half an hour.

Figure 31: The length of time that respondents think they would have to move to safety from approaching tsunami if they feel an earthquake at the beach

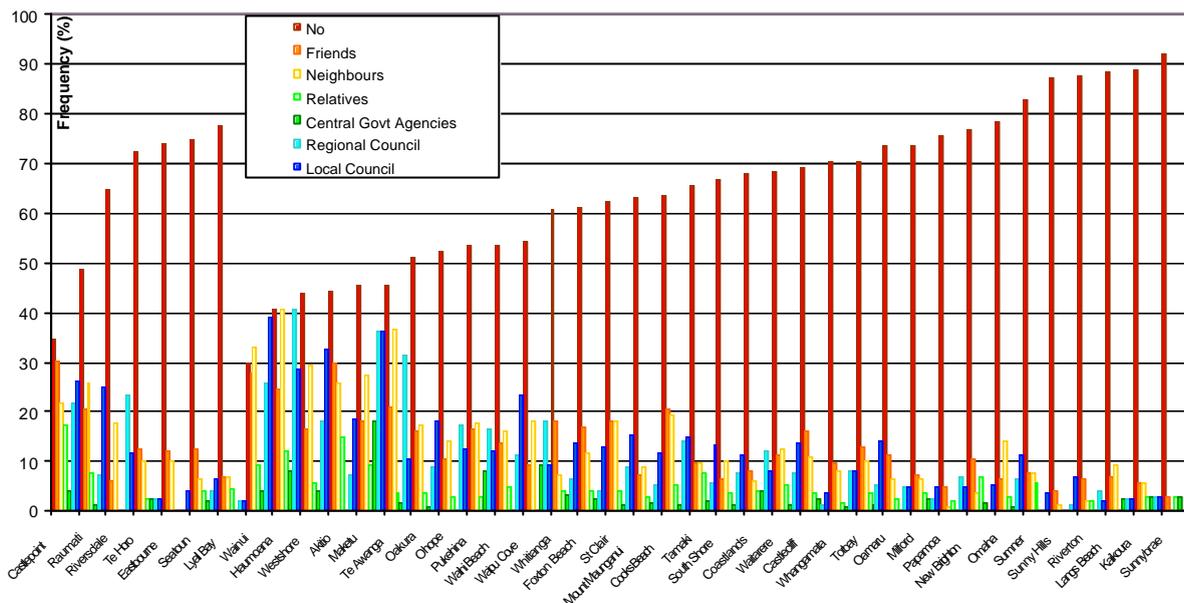

This question asked how much time people would have to move to safety from a tsunami following a strong earthquake. Again, nationally people tended to say that they did not know. Riversdale, Raumati and Eastbourne each favoured a few minutes. Despite signs at Castlepoint 47.8% of respondents did not know how long they would have.

9. Information

9.1 Receiving information

The survey asked if respondents had heard or received information about coastal erosion or tsunami from any of a number of agencies or groups. Respondents were given fourteen choices however Figures 32 and 33 show the seven main sources of information for each hazard.

Figure 32: Sources of coastal erosion information

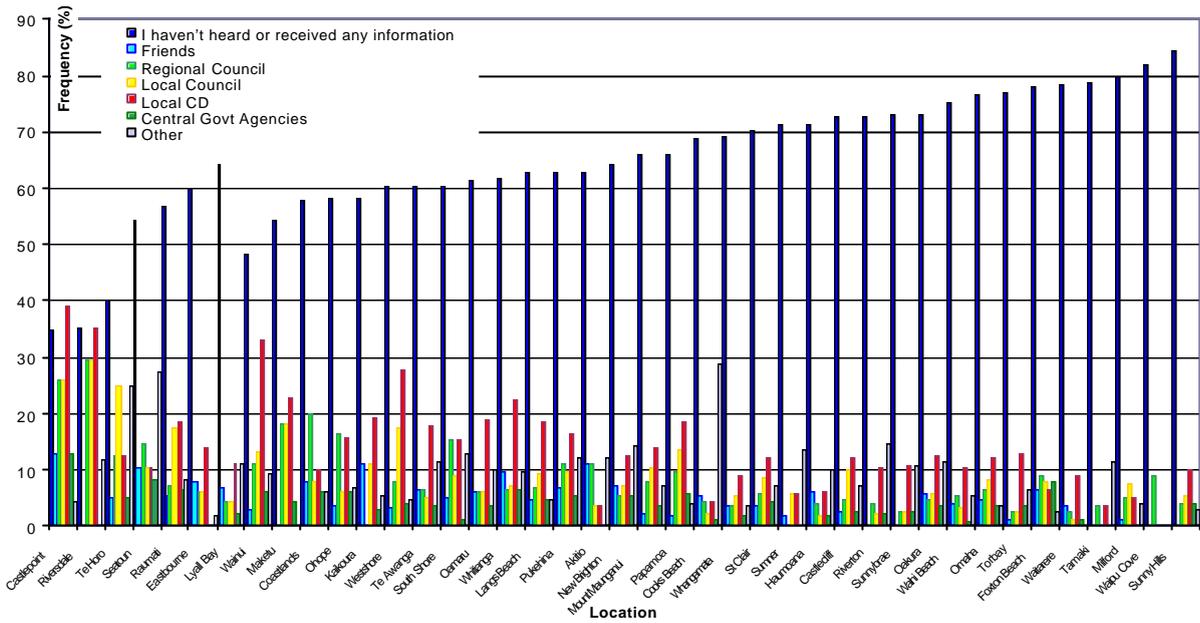

Nationally, an average of 38% of respondents had heard or received information from their local council, closely followed by regional councils on 35%.

‘Information from friends’ and ‘I haven’t heard or received any information’ stood at 28% and 27% respectively. Neighbours were the next most common source of information. Wellington Region trends followed those of the rest of the country although of note is the fact that 64.7% of Riversdale respondents had received or heard information from the Regional Council and 60.9% of Castlepoint respondents had obtained information from the local council. This could be as a result of a recent awareness campaign by Emergency Managers at Masterton District Council.

Raumati also rated highly for their local council providing information. 35% of Riversdale respondents had received information from research organisations, a much higher value than the rest of the region. Seatoun, Eastbourne and Lyall Bay each had more than 47% of respondents saying that they had not received any information on coastal erosion, almost twice the national average. Relatives rated relatively highly (26.1%) as a source of information for Castlepoint respondents but this percentage equals the percentage of the Castlepoint respondents who own a house elsewhere and are visiting, suggesting that they are staying with family who have informed them of the coastal erosion risk.

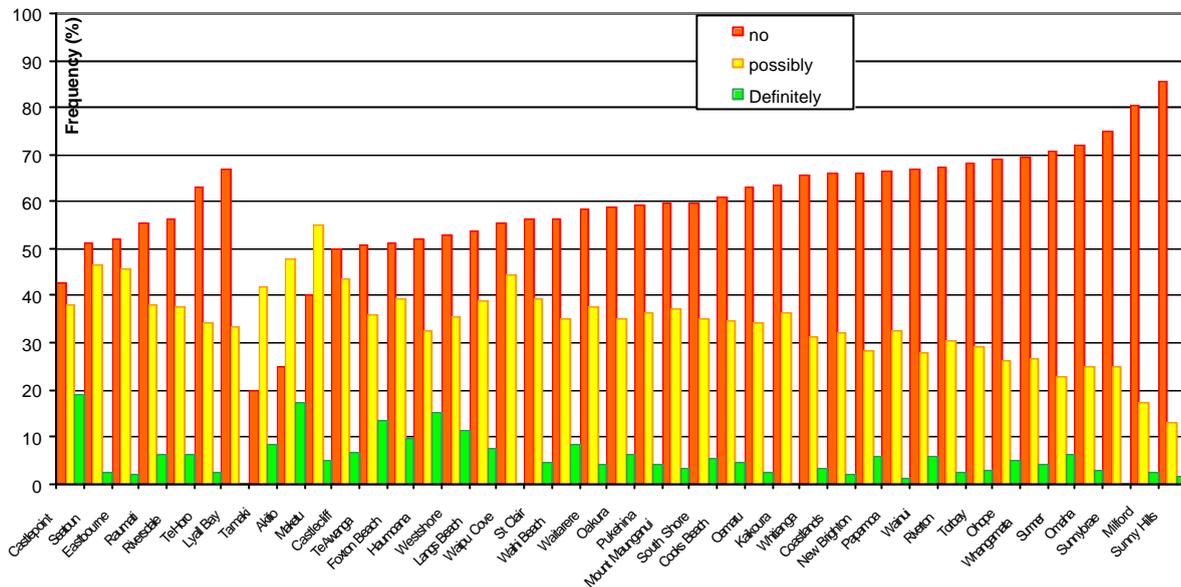

Figure 33: Sources of tsunami hazard information

The same question for tsunami brought a different response. An average of 49% of Wellington Region respondents and 68% of the rest of New Zealand had not heard or received any information on tsunami. Those that had received information got it from the local Civil Defence (20% for Wellington Region) and then the local council or regional council. Those in the Wellington Region were twice as likely as the rest of New Zealand to get information from the regional council (14% compared to 7%). These figures suggest that tsunami information is more readily available and respondents from Wellington Region are more informed of tsunami, which responses from previous tsunami questions have indicated.

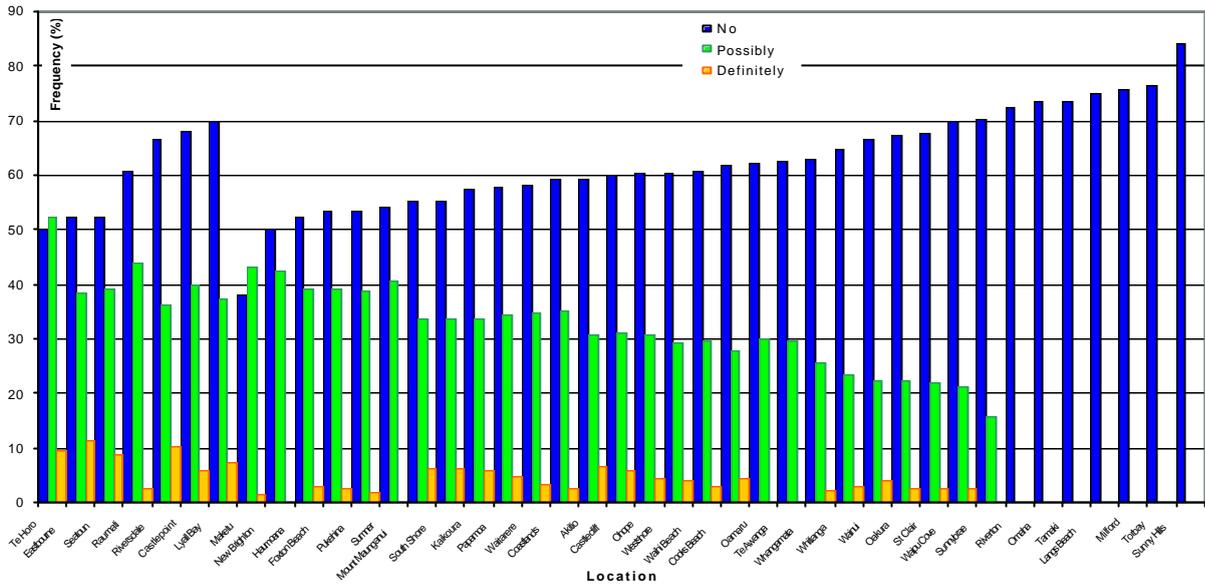

9.2 Seeking information

Figure 34: Proportion of respondents who intend to seek information on coastal erosion in the next month or so

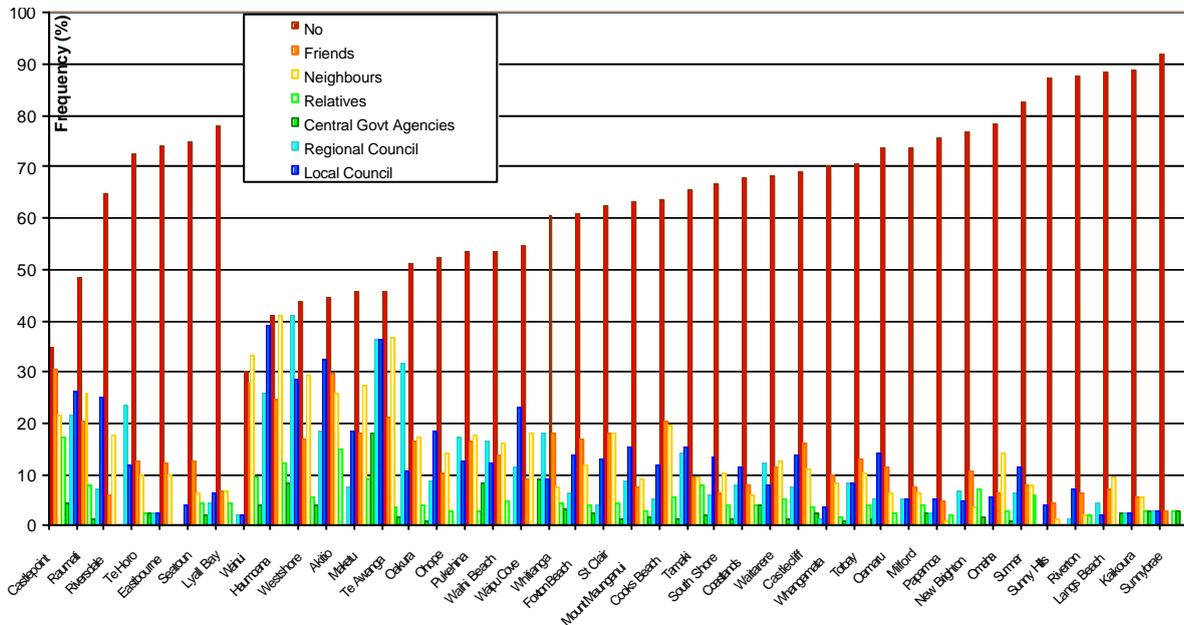

When asked if they intended to seek information on coastal erosion within the next month, an average of 59% of all respondents replied no with 35% saying possibly. The Wellington Region trends followed the national trends apart from an anomaly at Castlepoint where 19% of respondents said they would definitely seek information on coastal erosion in the next month or so. This value is higher than anywhere else in the country.

Figure 35: Proportion of respondents who intend to seek information on tsunami hazards in the next month or so

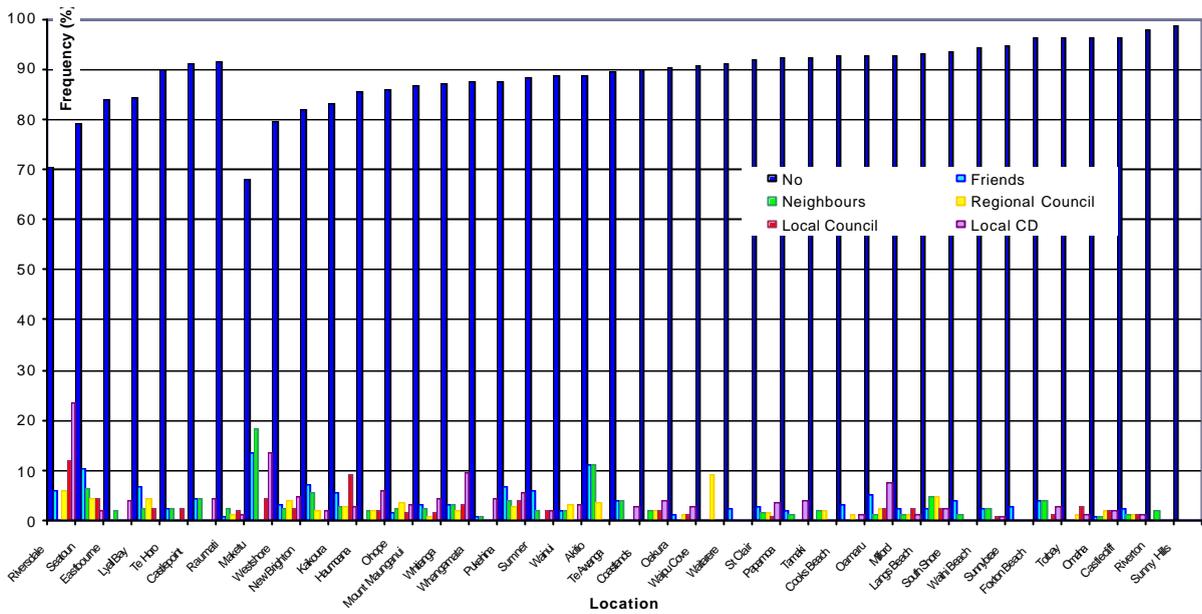

Similarly 62% on average of all respondents did not intend seeking information on tsunami hazards within the next month. 33% replied possibly. 42% of Te Horo respondents said possibly, the highest of any community surveyed in the country.

Figure 36: People, groups or organisations that respondents have sought coastal erosion information from

Respondents were asked if they had asked any of a number of people, groups or organisations for information on coastal erosion. The national average for 'I have not' was 65%. The next highest response (13%) was a tie between friends and neighbours then local council (12%) and regional council (10%).

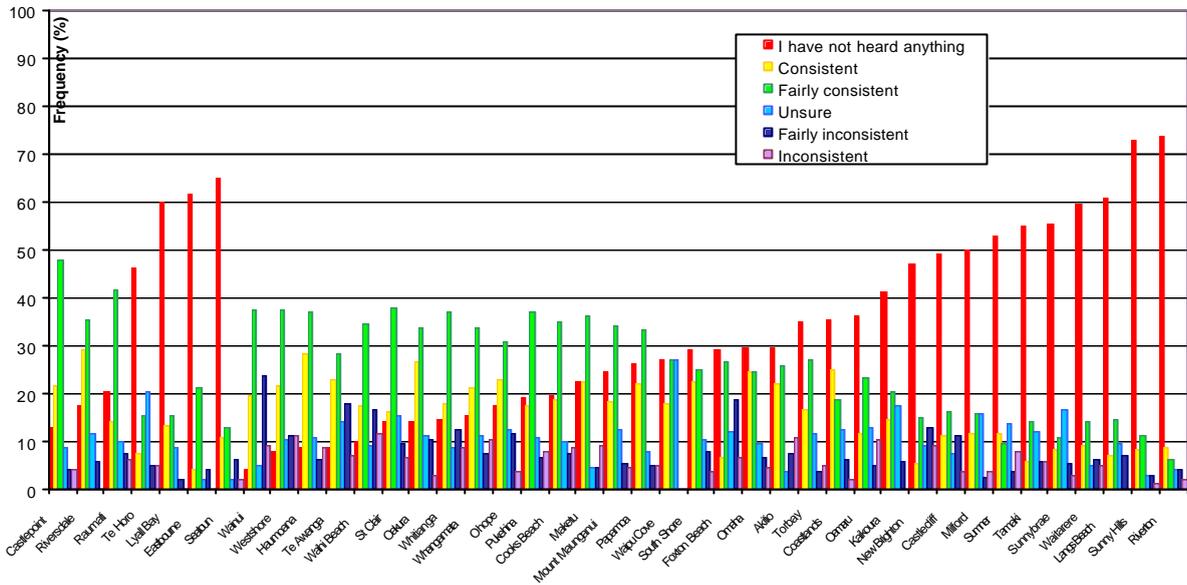

Figure 37: People, groups or organisations that respondents have sought tsunami hazard information from

Respondents were even less likely to have asked anybody for information pertaining to tsunami. An average of 89% of all respondents had not asked for information. There was no clear national trend differentiating between any of the other options. 23.5% of respondents from Riversdale had asked their local Civil Defence for information, much higher than the national average.

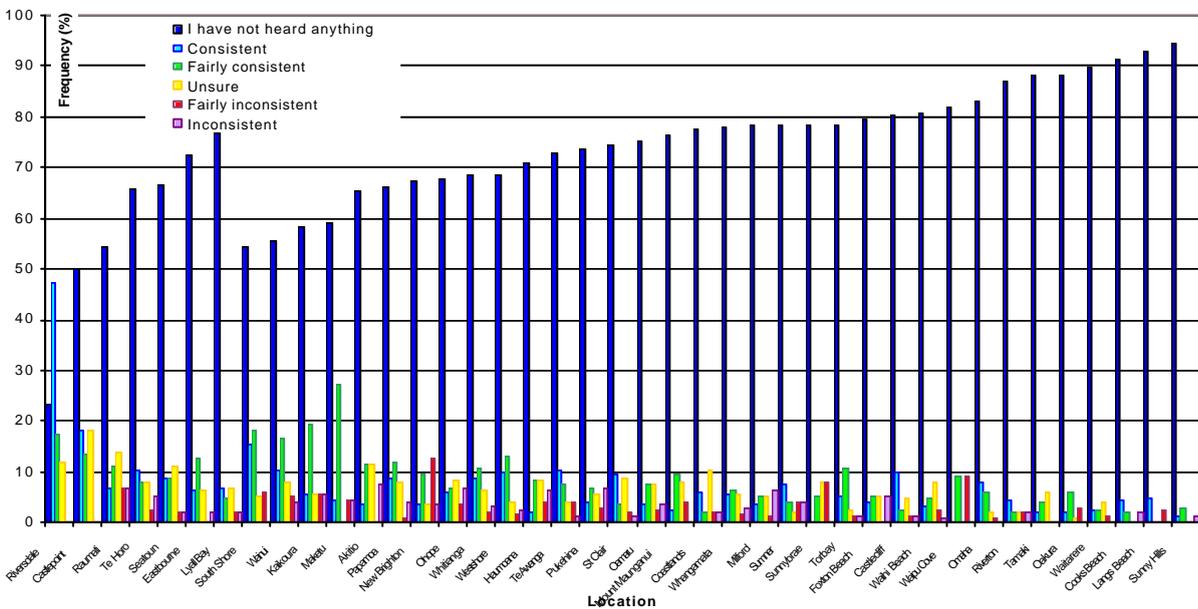

9.3 Consistency of information

Figure 38: The consistency of coastal erosion information

The consistency of the coastal erosion information received was questioned. For those people who had received information felt it was ‘fairly consistent’ (26% on average) or ‘consistent’ (16%). Lyall Bay, Eastbourne and Seatoun were all above 60% for ‘I have not heard anything’, well above the national average of 34%.

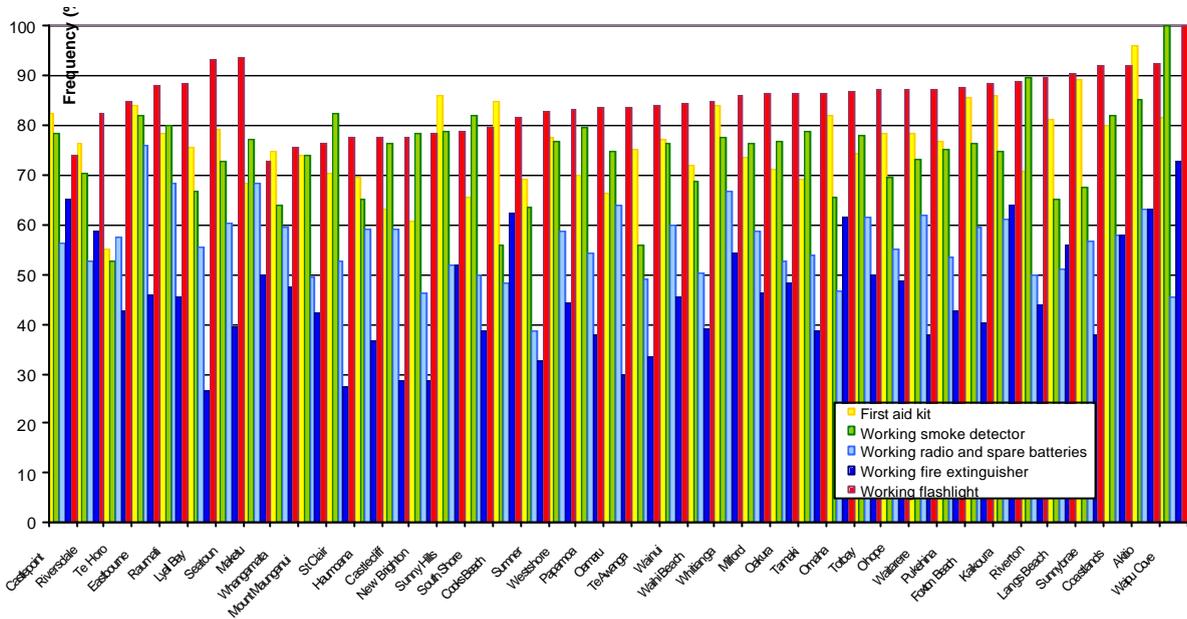

Figure 39: The consistency of tsunami hazard information

More people had not heard information on tsunami (an average of 59% for Wellington Region locations and 76% for the rest of New Zealand). Otherwise people replied that information was either ‘fairly consistent’ or ‘consistent’. On average, only 5% of the rest of New Zealand compared with 15% of Wellington Region respondents thought information was ‘consistent’. The Wellington figure was boosted by the fact that 47.1% of Riversdale respondents thought that information was consistent. This again indicates that tsunami information is more prevalent and more consistent than the rest of New Zealand.

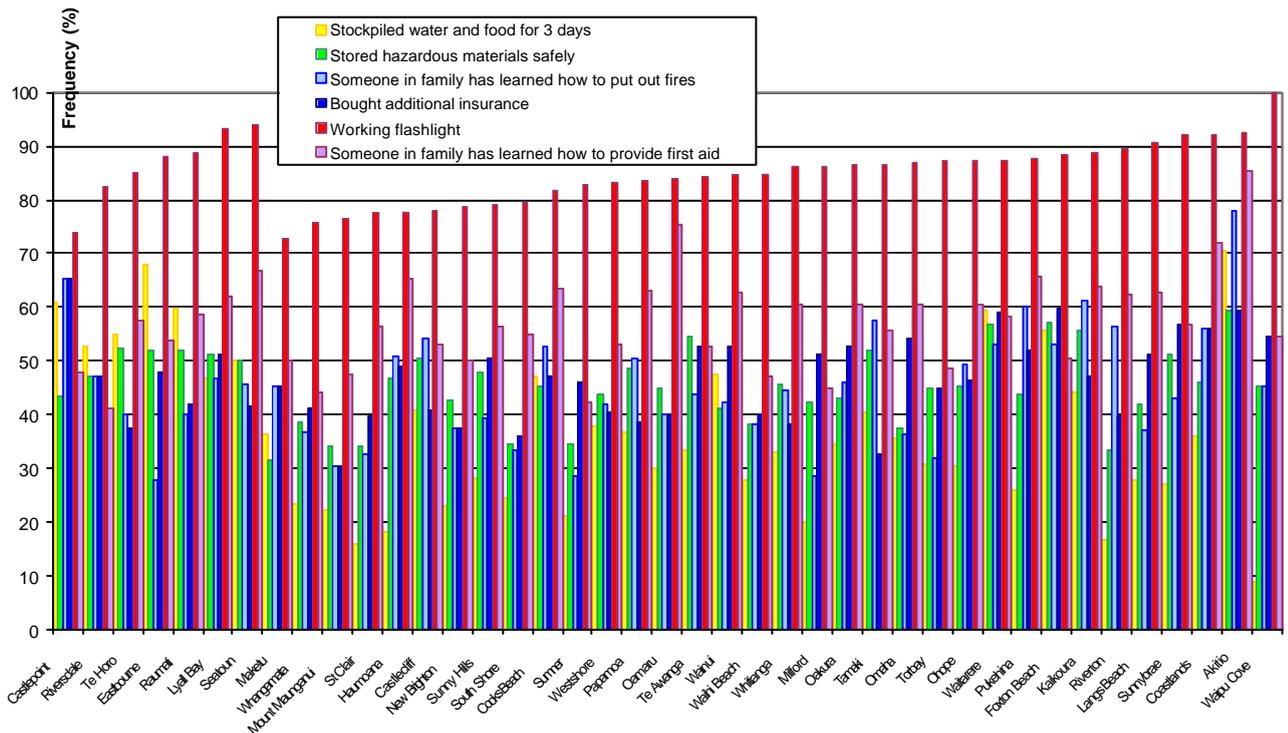

10. Preparedness

Figure 40a: Measures respondents have taken to prepare for hazard or emergency

When asked what their household had done to prepare for a hazard or emergency, nationally, on average, 85% of respondents had a working flashlight, 76% a first aid kit, 74% a smoke detector and 57% had learnt first aid. These measures were followed by having a radio and spare batteries, purchasing additional insurance, having a fire extinguisher and learning to put out fires.

Figure 40b: Measures respondents have taken to prepare for hazard or emergency

The Wellington region followed the national trends in most instances but there were some exceptions. On average, 56% of Wellington Region respondents had stockpiled enough food and water for three days compared with 33% of the rest of New Zealand. This means that respondents from the Wellington Region are just as likely to stockpile food as they are to have a radio with spare batteries. Respondents from the Wellington Region were also more likely to have found out the vulnerability of their area to natural hazards or to talk about tsunami. They were twice as likely as the rest of the country to ‘fix, fasten and forget’ in order to protect breakables.

Figure 40c: Measures respondents have taken to prepare for hazard or emergency

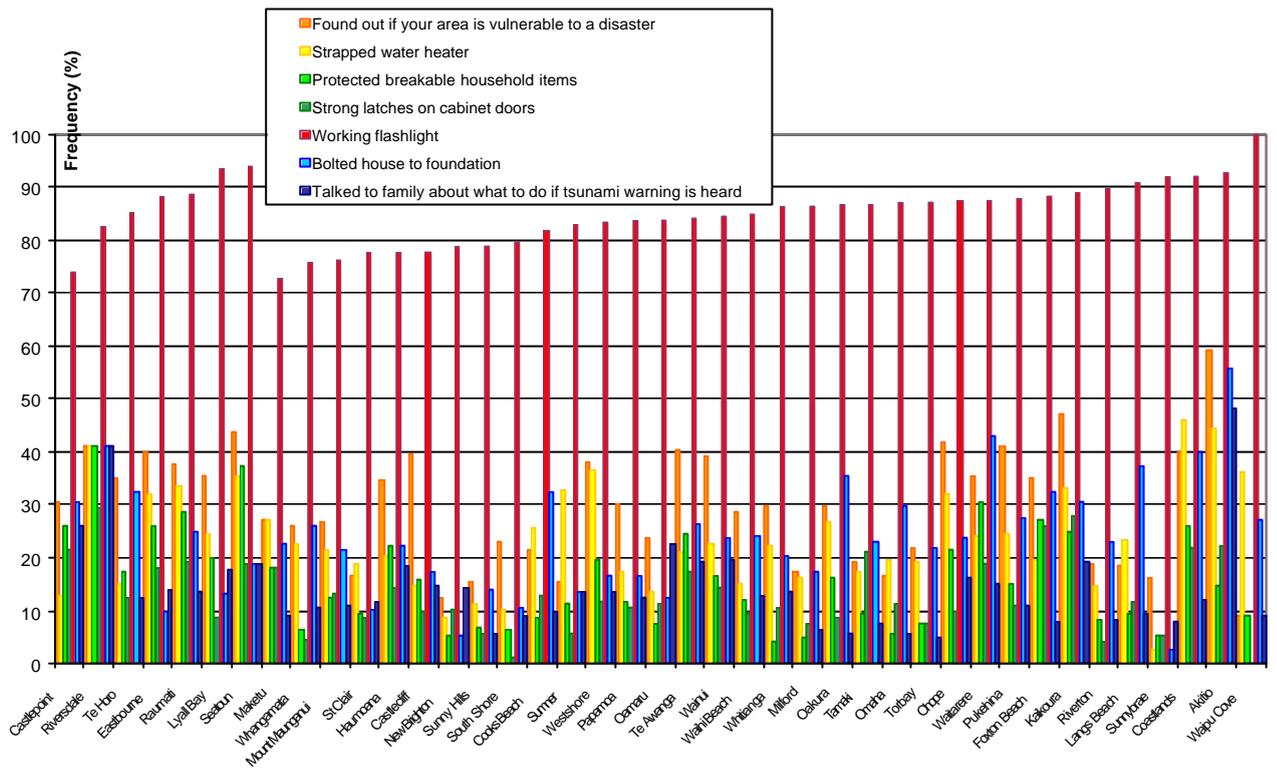

Figure 40d: Measures respondents have taken to prepare for hazard or emergency

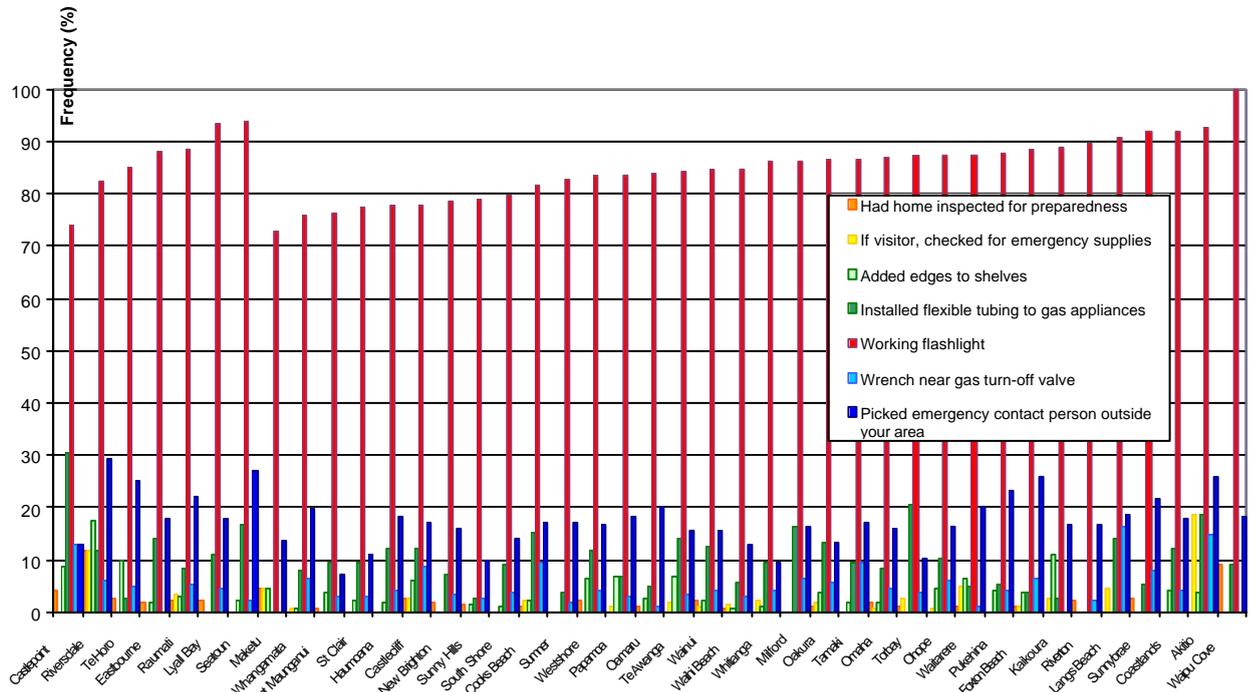

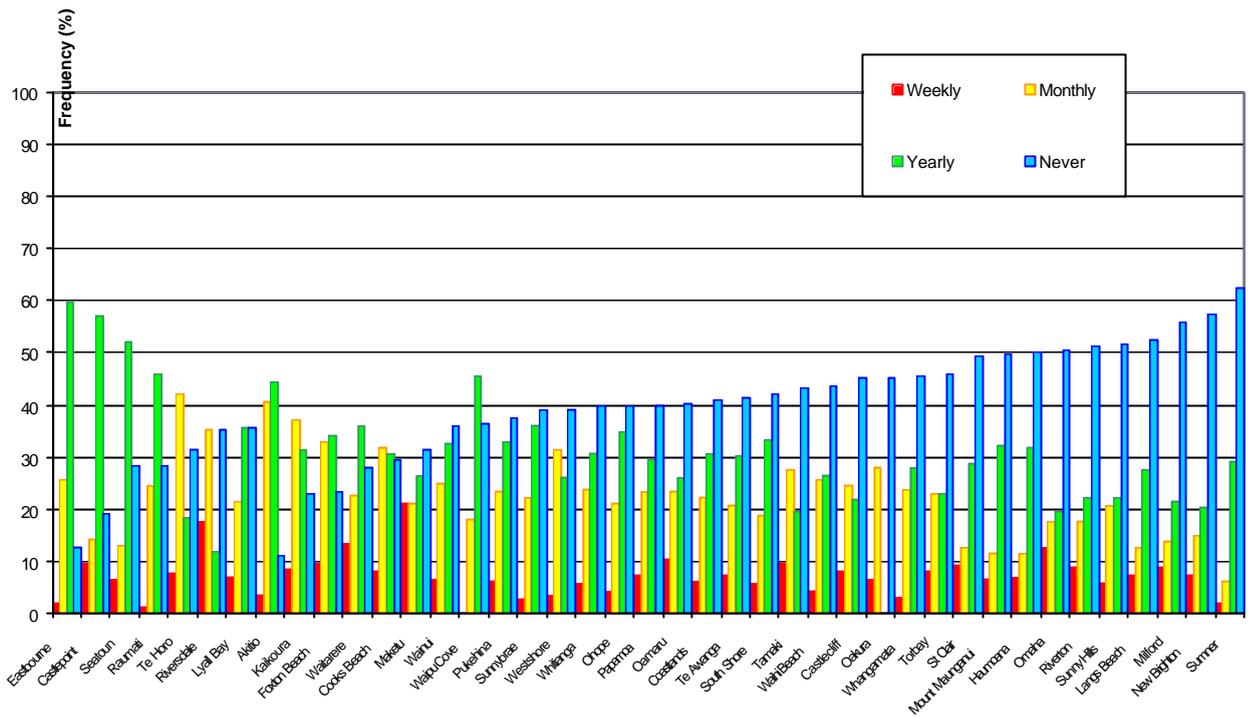

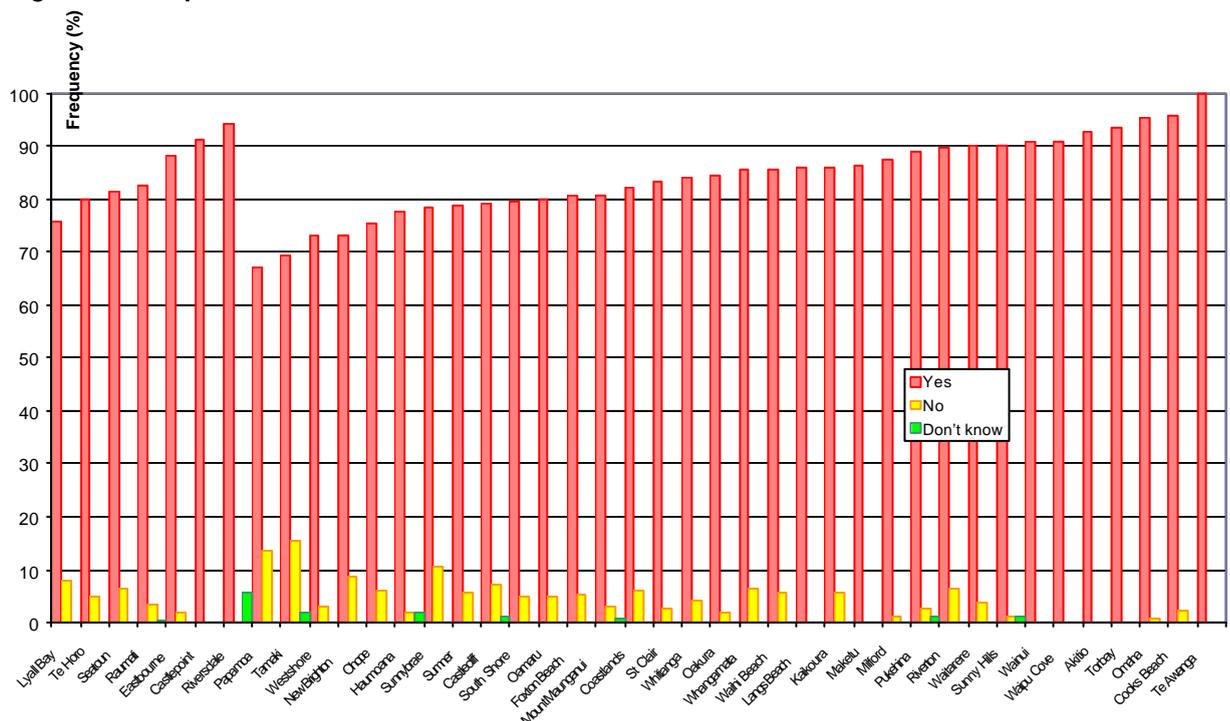

Figure 41: When respondents check their emergency supplies

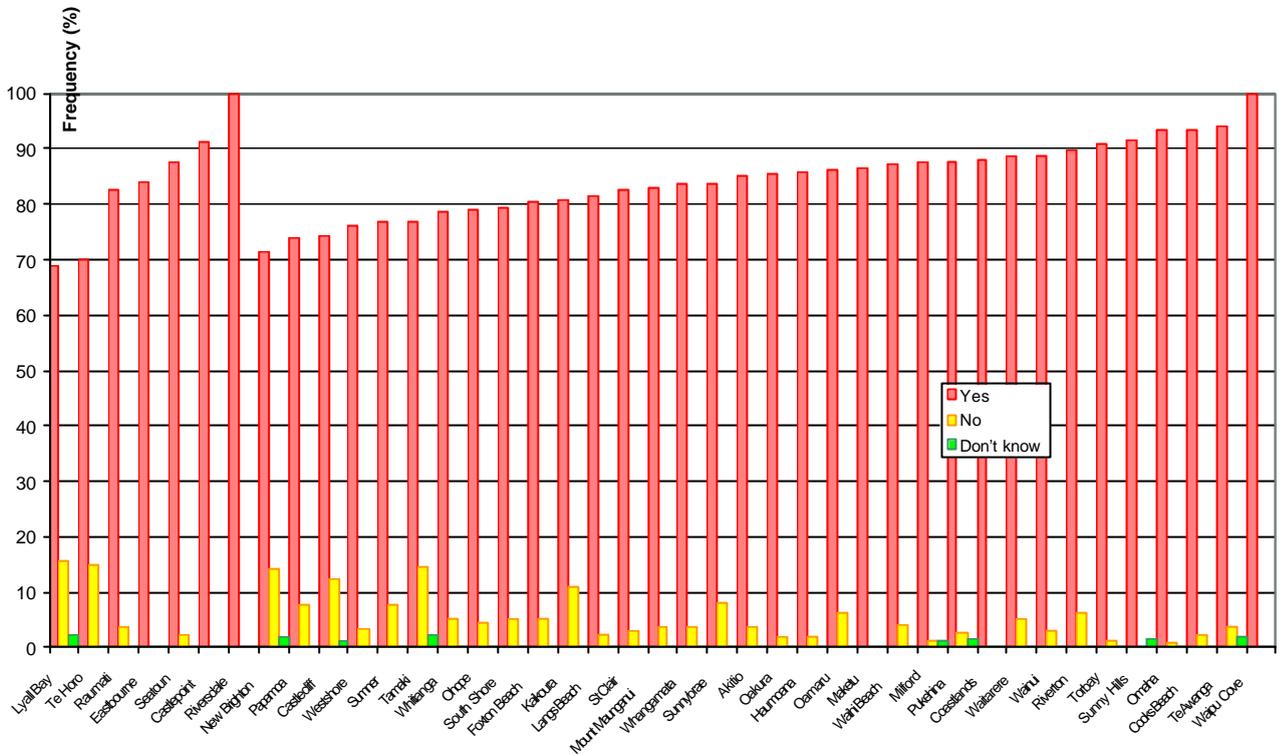

When asked how often they checked their emergency supplies like food, water and batteries, Wellington Region respondents appear to be setting an example for the rest of the country. On average, 40% of respondents from the Wellington Region check their supplies yearly compared with 29% of the rest of New Zealand. 42% on average of the rest of New Zealand never check their supplies compared with 27% for Wellington Region respondents. 42% of respondents from Te Horo and 35% from Riversdale say they check theirs monthly. Kaikoura and Cooks Beach were the only other communities where more respondents chose ‘monthly’ over the other options.

Figure 42: Proportion of residents with home insurance

The survey asked whether or not people had insurance for their home or contents. Respondents with home insurance averaged 84% nationally. All locales within the Wellington Region were at, or above 80%. More than 90% of respondents from Riversdale and Castlepoint had home insurance.

Figure 43: Proportion of respondents with contents insurance

The national average for contents insurance was also 84%. Interestingly, the average for contents insurance was exactly the same (84.3%) as that for home insurance for the Wellington Region. Castlepoint and Riversdale again had the highest levels with 100% of Riversdale respondents having contents insurance. It is important to remember that the Riversdale sample contains 17 people.

11. Key findings

Coastal erosion was identified by respondents as the hazard that most likely to affect their area. This was followed by storm with high winds and, in the Wellington Region, earthquake. For the rest of New Zealand the third option was flooding.

Despite coastal erosion being identified as most likely to affect their area, respondents tended not to think it could pose a threat to their daily activities and were unlikely to get information on it. Some of the Wellington Region communities - Riversdale, Castlepoint and Raumati - were more likely to get information on coastal erosion, while both Castlepoint and Riversdale respondents were more likely to say they would definitely join a group to discuss coastal erosion and methods for protecting against it.

Those people that had received information on coastal erosion mainly got it from local or regional councils. Castlepoint, Raumati and Riversdale in particular had a high proportion of respondents who had received information from either of these two sources. The information was rated by most people as fairly consistent or consistent. The majority of people who had not received or heard any information did not intend asking for any.

Tsunami, the fifth ranked hazard for the country was seen as possibly posing a threat to personal safety or daily activities. Despite this, people were even less likely to get tsunami information than coastal erosion information. Respondents from the Wellington Region did appear to be more informed, with more respondents saying that they had seen tsunami hazard zone maps and other information pertaining to tsunami. Local Civil Defence groups appear to provide most tsunami information to respondents, followed by local and regional councils. Respondents from the Wellington Region were twice as likely as the rest of New Zealand to get information from the Regional Council.

Respondents were highly unlikely to have asked for information on tsunami and did not intend doing so. If they had asked for information, they had approached neighbours, then friends or the local council. The information they had received was rated fairly consistent or consistent, with respondents from the Wellington Region more likely to rate information as consistent.

While the majority of respondents said they would move inland following a tsunami warning, most did not know how long they would have to evacuate, either after the warning or after an earthquake.

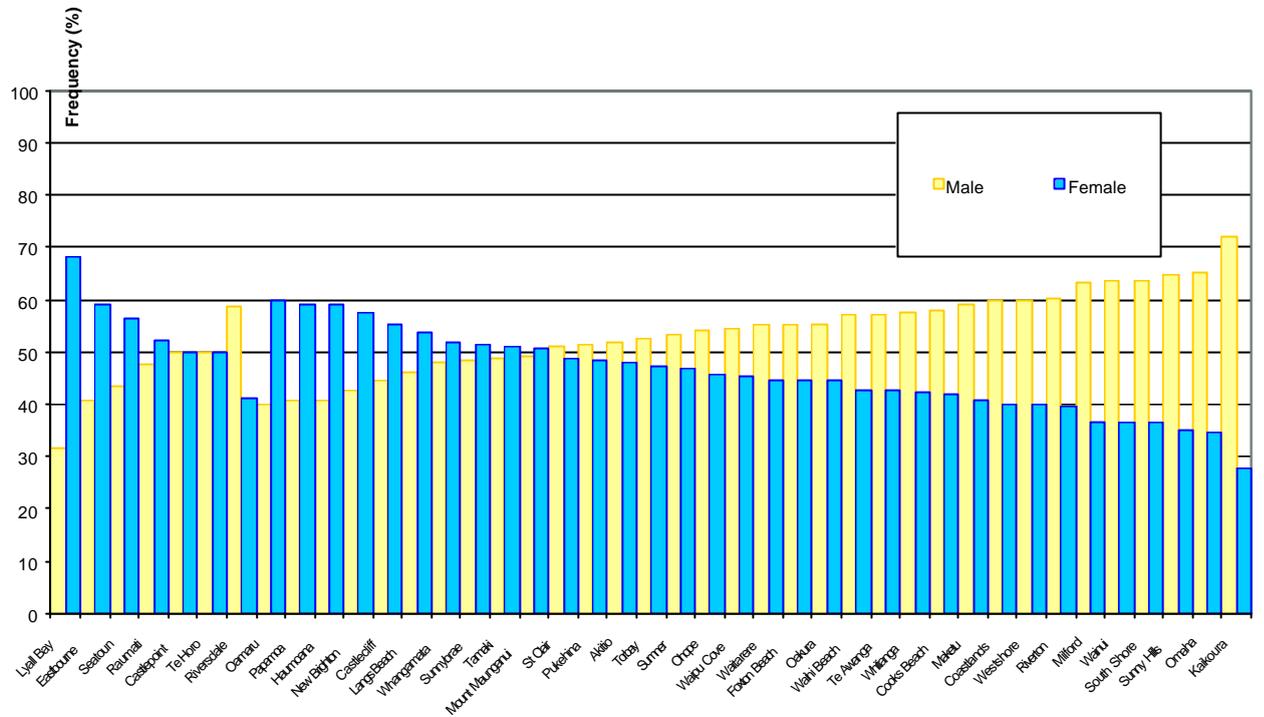

In terms of **preparedness**, flashlights (torches), a first aid kit and smoke detector are fairly standard items owned by the majority of New Zealanders. On average, more than half of respondents from the Wellington Region *reported** that they also stockpile food and water, compared to a third of the rest of the country. Respondents from the Wellington Region also check their supplies more regularly.

**This is a very high proportion of people, and research has shown that sometimes people over-report their level of preparedness.*

ABSTRACT

From January to June 2003 a national survey was conducted to build a picture of the social dynamics at work in coastal communities in relation to coastal hazards. This report presents the method, and tabulates the 3548 responses to approximately 50 questions from 42 coastal New Zealand communities. No analysis is included.

1.0 INTRODUCTION

New Zealanders love the seaside experience and want to live close to the sea — sometimes too close. Low-lying coastal communities are vulnerable to a range of different natural hazards (e.g. coastal erosion, tsunami, coastal flooding, sea-level rise) that come with varying levels of risk to coastal property, and to life and limb. Use of planning instruments under the RMA, NZ Coastal Policy Statement and Plans by territorial authorities to limit coastal property development is invariably contentious with local property owners. Coastal science research in New Zealand is relatively young (post-1960s). This, combined with New Zealand's diversity of coastal systems and lack of environmental monitoring, means the underpinning science to support the planning decisions is still qualitative and hence open to debate within the science community. Such a lack of data places real pressures on scientists and engineers to deliver more quantitative assessments of risk, while property owners and territorial authorities struggle with uncertainties in the knowledge and differences of “opinions” amongst experts. This volatile mix is compounded by issues of liability and insurability, with territorial authorities resorting to a precautionary approach to cover the uncertainties (and hence appearing to be overly restrictive). Property owners sometimes argue that they know the local risks best, based on their experience to date, rather than a scientist from “out-of-town”. A further contributing factor is that sea-level rise due to global warming, with associated increases in stormy weather, is predicted to have increasingly severe impacts on coastal communities for the next few centuries at least.

To date little is known about how aware residents and visitors are of the risks of living at and visiting the coast. A previous small community perception survey of Brighton Spit residents undertaken by Jenny Ridgen (unpublished, Christchurch City Council) provides some hints of community perception of risk and attitudes towards scientists/engineers. Most residents believed they were aware of coastal hazards, but that they were generally safe. The survey also found that education (90%) and awareness programmes (72%) were seen as useful adjuncts to planning mechanisms. Most perceived that the risk to their properties was minimal, with some suspicious of the evaluations of the risk put forward by coastal scientists. The Council was seen by some as relying too heavily on the “experts” and had not taken into account the fact that the existing dwellings had survived intact thus far. The findings from that small survey provided some of the impetus to develop a wide survey of the concerns of a broad cross-section of coastal communities throughout New Zealand, particularly owners of beachfront properties or canal estates.

From January to June 2003 a large-scale national survey of coastal residents and visitors was undertaken to determine perceptions of, and preparedness for, coastal hazards (mainly tsunami and coastal erosion). The survey aim was to build up a picture of the social dynamics at work in coastal communities.

1.1 Method

For any major community survey, careful thought must be given to the aims of the survey, the length and ease of use of survey forms, the style and unambiguous wording of the questions, and the logistics of survey (delivery, receipt, collation and data entry). Critical elements built into the design of the National Coastal Survey (2003) were as follows:

- Selling the vision that such a large national undertaking was possible through collaborations and partnerships;
- Collaborations between two crown research institutes (GNS and NIWA) were complemented by valuable input into the survey design by an environmental economist and social scientists from Environment Waikato;
- Partnerships with regional councils and territorial authorities were a key component of the success of the community surveys. These agencies provided additional funding, added endorsements to cover letters, helped select appropriate coastal communities, and provided additional site-specific questions in addition to the core content of the questionnaire.
- Beach resorts were surveyed during the peak summer holiday period when both residents and visitors have more leisure time to fill in survey forms.

The major objectives of the questionnaire were: (1) to assess perceptions of coastal risk in the context of other risks; (2) to assess levels of preparedness for emergencies; and (3) to assess views on management options and willingness to pay for the mitigation of coastal hazards. Specific questions were drawn up to address these objectives, and at this stage, the draft questionnaire was subjected to a wide-ranging consultation process. The final questionnaire contained nearly 50 questions covering perceived threats from a range of natural hazards, specific awareness of and preparedness for tsunami, perceptions of coastal erosion and mitigation strategies, general emergency preparedness, willingness to pay for coastal management options, and socioeconomic information about respondents.

Over 9000 questionnaires were delivered in 42 coastal communities from Riverton in the far south of the South Island to Waipu Cove in the Northland region of the North Island (Tables 1 and 2). Survey numbers and location were recorded to allow batches to be identified within a general geographical area, and thus be correlated to hazard zones and community characteristics. A visitors' survey was also distributed at beaches to target non-residents. The visitors' survey was based on a subset of questions from the residents' survey. Visitors were randomly selected from people present on the beach/coast, and from tent sites and vehicles. All visitor responses were returned by mail and there could, therefore, be no followup to increase the visitor return rate.

Table 1 Location, delivery date and return rates for the residents' survey (up until June 2003).

2.0 RESULTS

The survey results provide national and local data on coastal hazard risk perception. Preliminary analysis is in progress and the following sections of this report present an overview of the results.

3.0 HAZARD KNOWLEDGE AND EXPERIENCE

Table 3 The **two** natural hazards the respondent thinks are most likely to affect their community ('affect this community' for visitor respondents).

4.0 COASTAL EROSION

Coastal erosion is common around New Zealand's coastline, but is most noticeable and causes problems when human-made structures are threatened.

Table 6 For each statement, the mean is of all responses to this question on a scale from 1 (Not at all) to 5 (A great deal).

a) The respondent thinks about coastal erosion

	n	Mean	Standard Deviation
Langs Beach	41	3.27	1.162

6.0 CLIFF EROSION

Table 28 For each statement, the mean is of all responses to this question on a scale from 1 (Not at all) to 5 (A great deal).

a) The respondent thinks about cliff erosion

	n	Mean	Standard Deviation
Milford	76	2.24	0.992
Sunny Hills	71	2.18	1.086
Sunnybrae	35	2.06	0.938
Tamaki	50	2.60	1.161
Torbay	77	3.49	1.166

b) The respondent talks about cliff erosion

	n	Mean	Standard Deviation
Milford	70	1.79	0.976
Sunny Hills	65	1.68	1.002
Sunnybrae	34	1.71	0.871
Tamaki	45	2.04	1.043
Torbay	70	3.03	1.204

c) The respondent gets information on cliff erosion

	n	Mean	Standard Deviation
Milford	68	1.26	0.563
Sunny Hills	62	1.11	0.319
Sunnybrae	34	1.18	0.459
Tamaki	45	1.33	0.603
Torbay	65	1.80	1.078

d) The respondent thinks cliff erosion could pose a threat to their daily activities (such as work, leisure or property)

	n	Mean	Standard Deviation
Milford	71	1.76	0.948
Sunny Hills	66	1.80	1.099
Sunnybrae	34	1.82	1.086
Tamaki	46	2.30	1.533
Torbay	73	2.86	1.503

Table 29 To what extent does the respondent agree that: (for each statement, the mean is of all responses to this question on a scale from 1 (strongly agree) to 5 (strongly disagree))

a) Cliff erosion is unlikely to be a problem in their area in their lifetime

	n	Mean	Standard Deviation
Milford	77	3.36	1.347
Sunny Hills	70	2.49	1.359
Sunnybrae	35	3.57	1.357
Tamaki	49	2.92	1.484
Torbay	76	4.05	1.336

b) The local cliff top reserves/walkways will never be damaged by cliff erosion

	n	Mean	Standard Deviation
Milford	76	4.33	0.944
Sunny Hills	69	3.07	1.287
Sunnybrae	35	4.29	0.825
Tamaki	46	2.92	1.484
Torbay	75	4.72	0.669

c) The respondent's property will never be damaged by cliff erosion

	n	Mean	Standard Deviation
Milford	75	1.57	1.093
Sunny Hills	69	1.91	1.401
Sunnybrae	36	1.47	1.108
Tamaki	49	2.18	1.564
Torbay	75	2.87	1.671

Table 30 What does the respondent think is the main cause of cliff erosion?

	n	Natural processes	Storms	Sea-level rise	Other	Don't know
Milford	77	72.9	16.9	3.9	5.2	1.3
Sunny Hills	71	69.0	21.1	2.8	2.8	4.2
Sunnybrae	35	65.7	20.0	5.7	5.7	2.9
Tamaki	50	64.0	16.0	8.0	6.0	6.0
Torbay	78	66.7	21.8	2.6	6.5	2.6

Table 31 Has the respondent heard or received any information about cliff erosion from any of the following?

	36	37	38	39	40
n	80	71	37	52	78
I haven't heard or received any information	52.5	71.8	45.9	53.8	28.2

Other	7.5	8.5	10.8	13.5	15.4

Locations key: 36 – Milford, 37 - Sunny Hills, 38 – Sunnybrae, 39 – Tamaki and 40 – Torbay.

Table 32 In the next month or so, does the respondent intend to seek information on cliff erosion?

	n	No	Possibly	Definitely
Milford	70	85.7	12.9	1.4
Sunny Hills	67	91.0	9.0	0
Sunnybrae	32	81.3	18.8	0
Tamaki	47	66.0	31.9	2.1
Torbay	70	65.7	30.0	4.3

Table 33 Has the respondent asked any of the following people, groups or organisations for information on cliff erosion?

Locality	36	37	38	39	40
n	80	71	37	52	78
No	82.5	88.7	81.1	78.8	62.8
Friends	7.5	1.4	8.1	9.6	12.8
Neighbours	2.5	0	2.7	7.7	20.5
Relatives	2.5	2.8	8.1	3.8	3.8
Central Govt Agencies	0	0	2.7	0	0
Regional Council	0	4.2	5.4	3.8	5.1
Local Council	2.5	5.6	5.4	5.8	11.5
Local CD	0	0	0	0	1.3
Business Establishments	1.3	0	0	0	2.6
Research Organisations	2.5	0	0	0	5.1
My workplace	1.3	2.8	0	0	3.8
My child's school	0	1.4	0	0	0
Other	0	0	0	1.9	7.7

Locations key: 36 – Milford, 37 - Sunny Hills, 38 – Sunnybrae, 39 – Tamaki and 40 – Torbay.

Table 34 Thinking about what the respondent has heard about cliff erosion affecting their area, how consistent was this information?

	n	I have not heard anything	Consistent	Fairly consistent	Unsure	Fairly inconsistent	Inconsistent
Milford	79	49.4	12.7	19.0	12.7	2.5	3.8
Sunny Hills	70	80.0	4.3	5.7	5.7	1.4	2.9
Sunnybrae	37	48.6	13.5	13.5	16.2	5.4	2.7
Tamaki	49	71.4	6.1	6.1	14.3	2.0	0
Torbay	75	29.3	18.7	32.0	13.3	5.3	1.3

Table 35 What type of coastal defence for severely eroding cliff properties does the respondent most approve of?

	n	Nothing	Build a sea wall	Build a retaining or palisade wall	Plant appropriate plants on cliff face	Install drains to remove groundwater	Place large rocks at base of cliff	Require owners to move houses back	Other
Milford	80	7.5	6.3	3.8	33.8	26.3	10.0	6.3	5.2
Sunny Hills	69	4.3	18.8	1.4	49.3	7.2	13.0	5.8	0
Sunnybrae	37	16.2	10.8	8.1	24.3	2.7	18.9	18.9	0
Tamaki	49	2.0	30.6	6.1	34.7	14.3	6.1	2.0	4.0
Torbay	75	6.7	6.7	6.7	32.0	22.7	10.7	0	8.0

Table 36 If the respondent is a cliff top property owner, have they ever done any of the following to stabilise their cliff?

	n	I am not a cliff owner	Geotechnical study	Build a sea wall	Placed rocks at base of cliff	Build a retaining or palisade wall	Planted vegetation	Installed drainage	Other
Milford	80	90.0	0	0	0	0	1.3	2.5	0
Sunny Hills	71	83.1	1.4	1.4	1.4	0	8.5	4.2	1.4
Sunnybrae	37	94.6	0	2.7	0	2.7	0	0	0
Tamaki	52	84.6	0	1.9	3.8	0	3.8	5.8	0
Torbay	78	57.7	21.8	0	0	3.8	26.9	21.8	5.1

Table 37 If a cliffed reserve is eroding and in the long term the erosion may reach private property or a public walkway, does the respondent think the council should stabilise the cliff to:

a) Protect private property

	n	Yes	No
Milford	77	72.7	27.3
Sunny Hills	71	84.5	15.5
Sunnybrae	36	58.3	41.7
Tamaki	50	88.0	12.0
Torbay	75	66.7	33.3

b) Protect a walkway

	n	Yes	No
Milford	77	87.0	13.0
Sunny Hills	71	97.2	2.8
Sunnybrae	35	74.3	25.7
Tamaki	50	92.0	8.0
Torbay	76	84.2	15.8

7.0 COMMUNITY ISSUES

Table 38 Following is a list of statements on how the respondent feels about living in their area: (for each statement, the mean is of all responses to this question on a scale from 1 (Disagree strongly) to 5 (Agree strongly))

a) The respondent feels 'at home' in this community

	n	Mean	Standard Deviation
Langs Beach	33	4.61	0.788
Waipu Cove	8	4.13	0.835
Omaha	68	4.44	0.761

9.0 ACKNOWLEDGEMENTS

This project has received funding from Institute of Geological & Nuclear Sciences, National Institute of Water and Atmospheric Research, Auckland Regional Council, Environment Waikato, Environment BoP, Gisborne District Council, Hastings District Council, Horizon MW, Greater Wellington and Environment Canterbury. We would also like to thank our field assistants Kirsten Finnis, Jess Ward, Anna Wood and Vicki Carlyon who helped deliver the thousands of questionnaires. The financial support of the NZ Foundation for Research Science and Technology for NIWA and GNS funding is acknowledged under Contracts C01X0218 and C05X0209.
